### EE 330 Lecture 2

### **Basic Concepts**

Attendance:

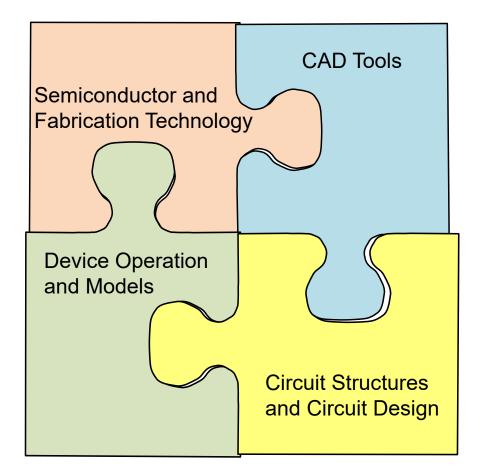

Select a seat when you come to class on Friday

### Review from last lecture: How Integrated Electronics will be Approached

### How Integrated Electronics will be Approached

After about four weeks, through laboratory experiments and lectures, the concepts should come together

### How big is the semiconductor industry?

ABOUT - SEMIS 101 - POLICY - MARKET DATA & RESOURCES - NEWS & EVENTS -

Global Semiconductor Sales Increase 24% Year-to-Year in October; Annual Sales Projected to Increase 26% in 2021, Exceed \$600 Billion in 2022

Friday, Dec 03, 2021, 4:30pm by **Semiconductor Industry Association** 

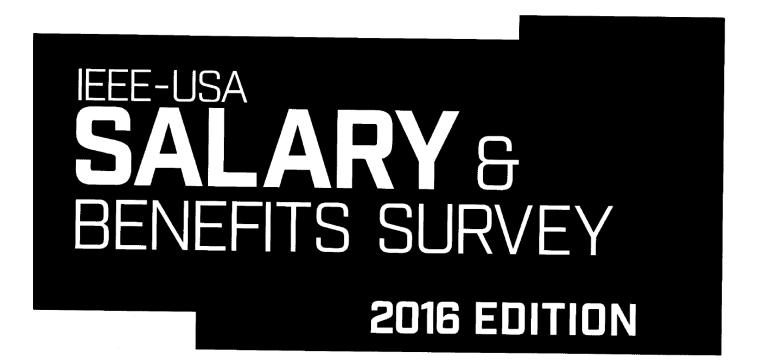

- Annual sales around \$600B in 2022
- 25% annual growth rate
- Unprecedented demand for engineers in the field

### Is an automobile an electronics "gadget"?

### Rewards in the Electronics Field

Can engineers working in the semiconductor electronics field make a good living?

#### 2015 Primary Income by Primary Area of Technical Competence

	Number of Cases	Lowest Decile	Lower Quartile	Median	Upper Quartile	Highest Decile
	7,391	\$79,200	\$103,000	\$135,000	\$173,000	\$223,000
CIRCUITS AND DEVICES	1,127	\$85,000	\$110,000	\$144,700	\$182,878	\$240,000
Circuits and Systems	416	\$79,750	\$100,991	\$130,000	\$165,000	\$210,000

Intel Core i9 10900K 14nm CMOS

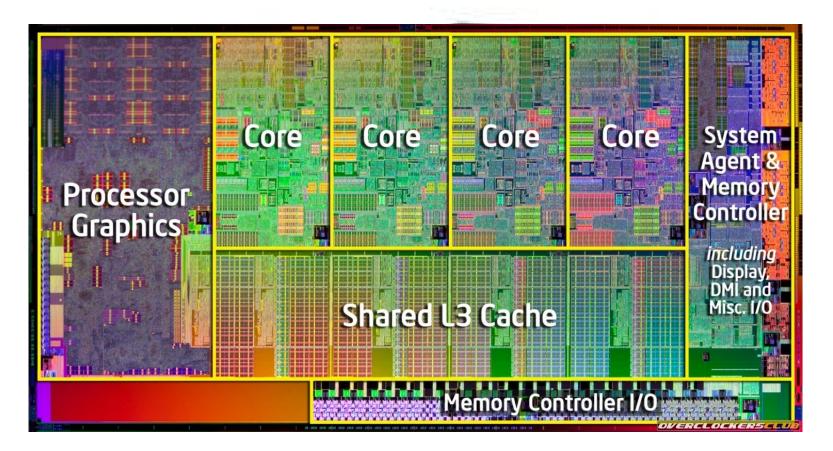

### **Recent Intel Processor**

Processor

8 cores, Intel<sup>®</sup> Core i9 Processor, 5.0 GHz Power Dissipation: 125 watts

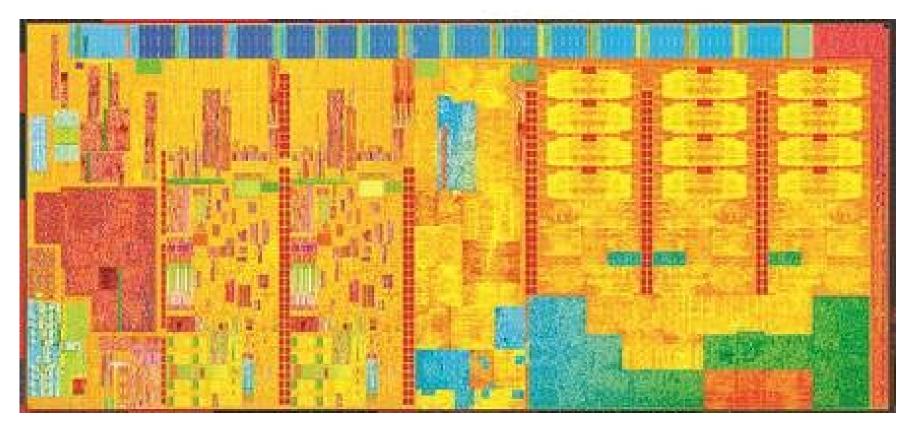

### **Recent Intel Processor**

Processor

Quad-Core Intel<sup>®</sup> Core i7 Processor Up to 3.4GHz in 32nm CMOS Power Dissipation: 95 watts

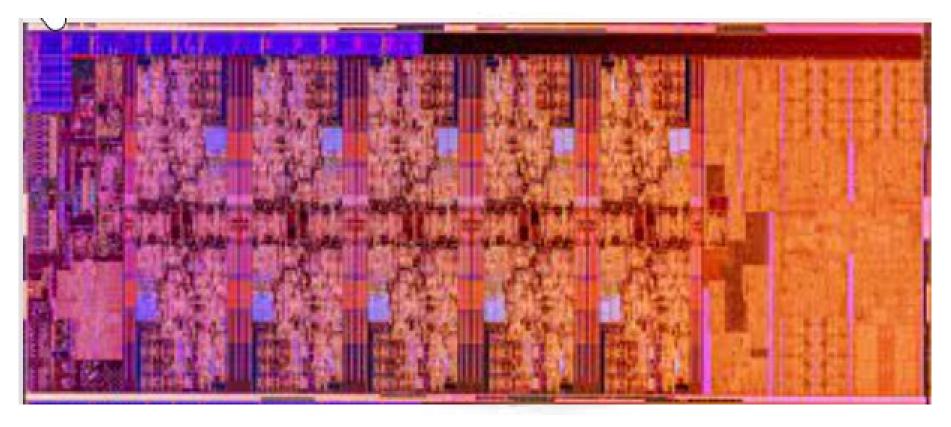

#### Processor

8-core (2.6B) or 18-core Broadwell Intel<sup>®</sup> Core M Processor in 14nm CMOS Intel Tic-Toc product ("Toc" from 22nm Haswell processor) Power Dissipation: 4.9 watts

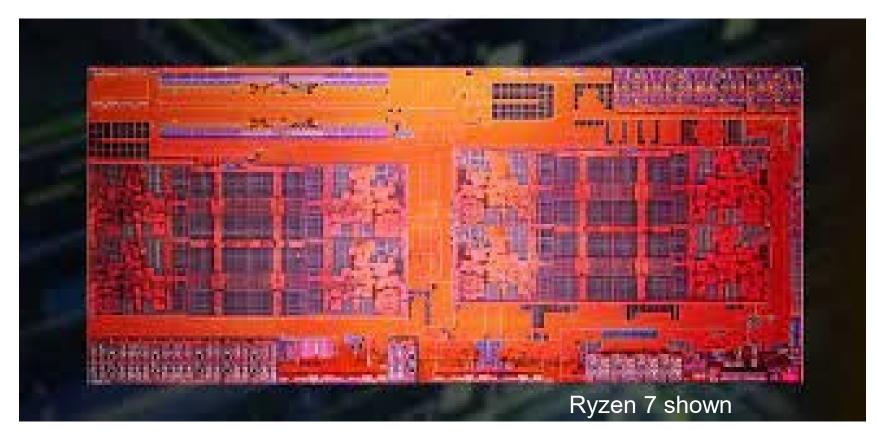

Processor Intel Core i9 10900K

10-core Processor in 14nm CMOS, 3.7GHz

Power Dissipation: 125 watts

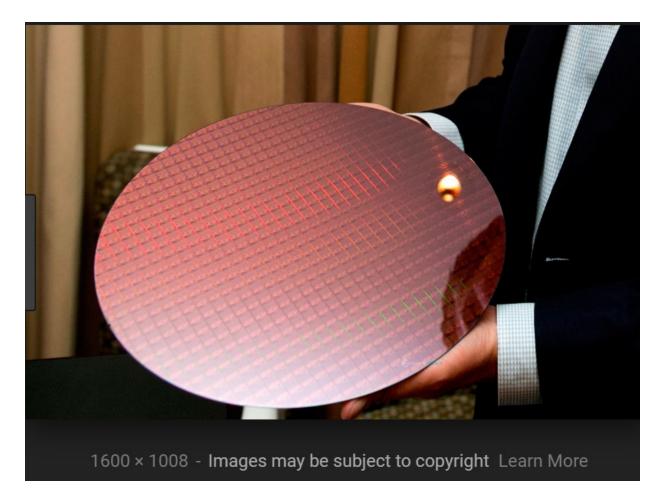

Processor AMD Ryzen 5950X

16-core Processor in 7nm CMOS, 3.4-4.9 GHz

Power Dissipation: 105 watts

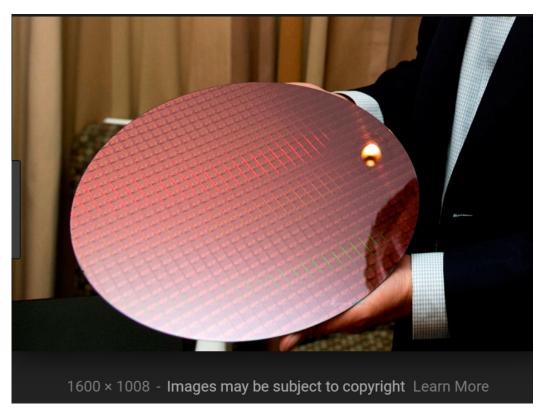

### A bit ago!

**Cannon Lake Processor** 

10nm CMOS i3-8121U Delayed production schedule – expected to ramp up in 2019

### A bit ago!

#### Cannon Lake Processor

#### Press release from Intel – May 28, 2019

But now, <u>after years of delays</u>, the company is about to bring its first real batch\* of 10nm CPUs to the world. Today, the company is officially taking the wraps off its 10th Gen Intel Core processors, codename "Ice Lake," and revealing some of what they might be able to do for your next PC when they ship in June.

Update: Intel discontinued the Cannon Lake Processor on Feb 28, 2020

### Yesterday!

#### Processors

Processor	MOS transistor count	Date of introduction ◆	Designer 🔶	MOS process ✦ (nm)	Area (mm²) 🗧
MP944 (20-bit, 6-chip, 28 chips total)	74,442 (5,360 excl. ROM & RAM) <sup>[24][25]</sup>	1970 <sup>[22][a]</sup>	Garrett AiResearch	?	?

# Selected Semiconductor Trends

- Microprocessors
  - State of the art technology is now 5 nm with over 40
     Billion transistors on a chip
- DRAMS
  - State of the art is now 128G bits on a chip in a 10nm process which requires somewhere around 140 Billion transistors
- FPGA
  - FPGAs currently have over 90 Billion transistors with 7nm technology and are growing larger
     Device count on a chip has been increasing rapidly with time, device size has been decreasing rapidly with time and speed/performance has been rapidly increasing

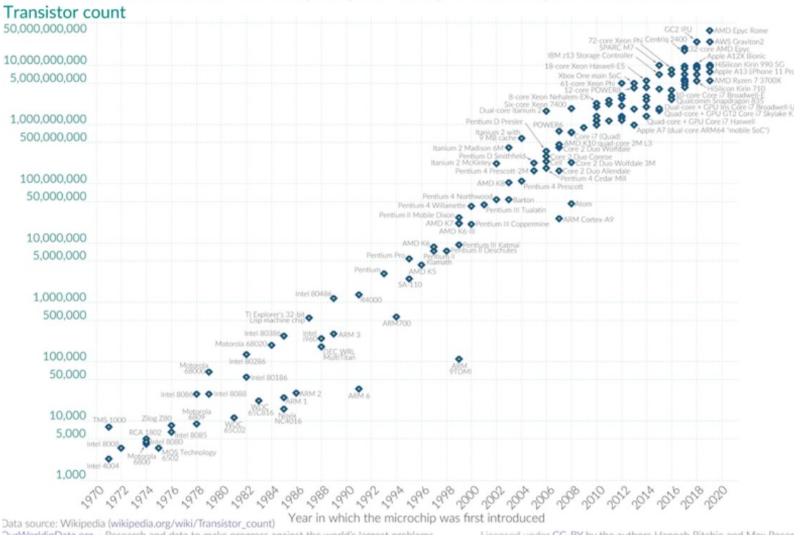

# Moore's Law

From Webopedia (Aug 2016)

The observation made in 1965 by Gordon Moore, co-founder of <u>Intel</u>, that the number of <u>transistors</u> per square inch on <u>integrated circuits</u> had doubled every year since the integrated circuit was invented. Moore predicted that this trend would continue for the foreseeable future. In subsequent years, the pace slowed down a bit, but <u>data</u> density has doubled approximately every 18 months, and this is the current definition of Moore's Law, which Moore himself has blessed. Most experts, including Moore himself, expect Moore's Law to hold for at least another two decades.

### Moore's Law: The number of transistors on microchips doubles every two years

Moore's law describes the empirical regularity that the number of transistors on integrated circuits doubles approximately every two years. This advancement is important for other aspects of technological progress in computing – such as processing speed or the price of computers.

#### Transistors Could Stop Shrinking in 2021

A key industry report forecasts an end to traditional scaling of transistors

Posted 22 Jul 2016 | 13:04 GMT By RACHEL COURTLAND

#### Moore's Law Running Out of Room, Tech Looks for a Successor - The ...

https://www.nytimes.com/.../moores-law-running-out-of-room-tech-looks-for-a-successo... May 4, 2016 - "The **end** of **Moore's Law** is what led to this," said Thomas M. Conte, a Georgia Institute of Technology computer scientist and co-chairman of ...

# Moore's Law

From Wikopedia (Aug 2017)

....However, in April 2016, Intel CEO Brian Krzanich stated that "In my 34 years in the semiconductor industry, I have witnessed the advertised death of Moore's Law no less than four times. As we progress from 14 nanometer technology to 10 nanometer and plan for 7 nanometer and 5 nanometer and even beyond, our plans are proof that Moore's Law is alive and well".<sup>[25]</sup> In January 2017, he declared that "I've heard the death of Moore's law more times than anything else in my career ... And I'm here today to really show you and tell you that Moore's Law is alive and flourishing."<sup>[26]</sup>

Today hardware has to be designed in a <u>multi-core</u> manner to keep up with Moore's law. In turn, this also means that software has to be written in a <u>multi-threaded</u> manner to take full advantage of the hardware.

# Moore's Law

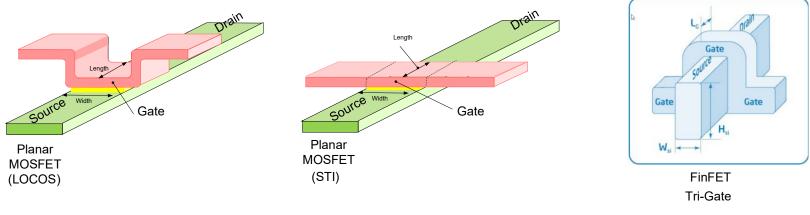

(from Wikipedia)

**Moore's law** is the <u>empirical</u> observation that the <u>complexity</u> of <u>integrated</u> <u>circuits</u>, with respect to minimum component cost, doubles every 24 months[1]. It is attributed to <u>Gordon E. Moore[2]</u>, a co-founder of <u>Intel</u>.

- Observation, not a physical law
- Often misinterpreted or generalized
- Many say it has been dead for several years
- Many say it will continue for a long while
- Not intended to be a long-term prophecy about trends in the semiconductor field
- Something a reporter can always comment about when they have nothing to say!

Device scaling, device count, circuit complexity, device cost, ... in leadingedge processes will continue to dramatically improve (probably nearly geometrically with a time constant of around 2 years ) for the foreseeable future !!

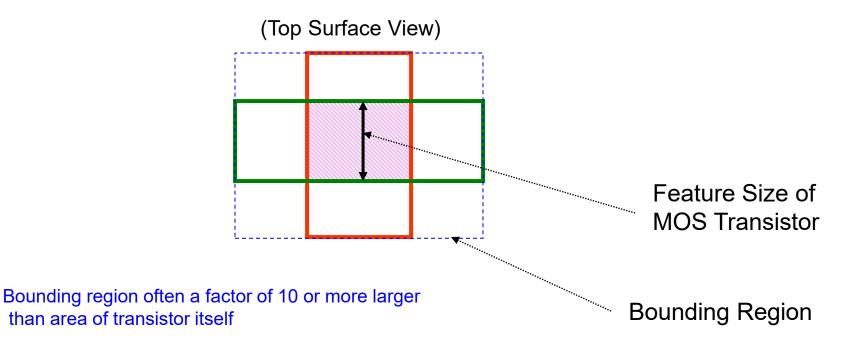

## Field Effect Transistors

Dielectric not shown

# **Feature Size**

The feature size of a process generally corresponds to the minimum lateral dimensions of the transistors that can be fabricated in the process

• This along with interconnect requirements and sizing requirements throughout the circuit create an area overhead factor of 10x to 100x

# Challenges

- Managing increasing device count
- Short lead time from conception to marketplace
- Process technology advances
- Device performance degradation
- Increasing variability
- Increasing pressure for cost reduction
- Power dissipation

# Future Trends and Opportunities

• Is there an end in sight?

No! But the direction the industry will follow is not yet known but the role semiconductor technology plays on society will increase dramatically!

• Will engineers trained in this field become obsolete at mid-career ?

No! Engineers trained in this field will naturally evolve to support the microelectronics technology of the future. Integrated Circuit designers are now being trained to efficiently manage enormous levels of complexity and any evolutionary technology will result in even larger and more complexity systems with similar and expanded skills being required by the engineering community with the major changes occurring only in the details.

# Future Trends and Opportunities

 Will engineers trained in this field be doing things the same way as they are now at midcareer?

No! There have been substantive changes in approaches every few years since 1965 and those changes will continue. Continuing education to track evolutionary and revolutionary changes in the field will be essential to remain productive in the field.

 What changes can we expect to see beyond the continued geometric growth in complexity (capability) ?

That will be determined by the creativity and marketing skills of those who become immersed in the technology. New "Gordon Moores", "Bill Gates" and "Jim Dells" will evolve.

# **Creation of Integrated Circuits**

Most integrated circuits are comprised of transistors along with a small number of passive components and maybe a few diodes

This course will focus on understanding how transistors operate and on how they can be interconnected and possibly combined with a small number of passive components to form useful integrated circuits

#### Texas Instruments:

- World's largest producer of analog semiconductors at \$15.4B, over 100% larger than closest competitor
- Ranks 1<sup>st</sup> in DSP
- Ranks 9<sup>th</sup> in World in semiconductor sales

Number of employees: 31,000

2022 sales: \$20B 2022 income: \$8.7B

(after taxes)

Average annual sales/employee: \$645K

#### Average annual earnings/employee: \$280K

\$15.36 \$3.26 \$1.41 Analog Embedded Other (in billions of dollars) Capital expenditures: \$2.8 billion R&D: \$1.7 billion
