Lecture 2

Basic Concepts

Photo courtesy of the director of the National Institute of Health (NIH)

As a courtesy to fellow classmates, TAs, and the instructor

Wearing of masks during lectures and in the laboratories for this course would be appreciated irrespective of vaccination status

Review from last lecture:

Grading Policy

3 Exams	100 pts each
1 Final	100 pts.
Homework	100 pts.total
Lab and Lab Reports	100 pts.total
Design Project	100 pts.

- A letter grade will be assigned based upon the total points accumulated
- Grade breaks will be determined based upon overall performance of the class

Equal Access Policy

Participation in all class functions and provisions for special circumstances including special needs will be in accord with ISU policy

Participation in any classes or laboratories, turning in of homework, or taking any exams is optional however grades will be assigned in accord with the described grading policy. No credit will be given for any components of the course without valid excuse if students choose to not contribute. Successful completion of ALL laboratory experiments and submission of complete laboratory reports for ALL laboratory experiments to TA by deadline established by laboratory instructor is, however, required to pass this course.

Review from last lecture:

How Integrated Electronics will be Approached

Review from last lecture:

How Integrated Electronics will be Approached

After about four weeks, through laboratory experiments and lectures, the concepts should come together

Review from last lecture:

How big is the semiconductor industry?

Cannon Lake Processor

Press release from Intel – May 28, 2019

But now, after years of delays, the company is about to bring its first real batch* of 10nm CPUs to the world. Today, the company is officially taking the wraps off its 10th Gen Intel Core processors, codename “Ice Lake,” and revealing some of what they might be able to do for your next PC when they ship in June.

Update: Intel discontinued the Cannon Lake Processor on Feb 28, 2020

Selected Semiconductor Trends

- Microprocessors
 - State of the art technology is now 5 nm with over 40 Billion transistors on a chip
 - DRAMS
 - State of the art is now 128G bits on a chip in a 10nm process which requires somewhere around 140 Billion transistors
 - FPGA
 - FPGAs currently have over 90 Billion transistors with 7nm technology and are growing larger
- Device count on a chip has been increasing rapidly with time, device size has been decreasing rapidly with time and speed/performance has been rapidly increasing

Moore's Law

From Webopedia (Aug 2016)

The observation made in 1965 by Gordon Moore, co-founder of [Intel](#), that the number of [transistors](#) per square inch on [integrated circuits](#) had doubled every year since the integrated circuit was invented. Moore predicted that this trend would continue for the foreseeable future. In subsequent years, the pace slowed down a bit, but [data](#) density has doubled approximately every 18 months, and this is the current definition of Moore's Law, which Moore himself has blessed. Most experts, including Moore himself, expect Moore's Law to hold for at least another two decades.

Moore's Law: The number of transistors on microchips doubles every two years

Moore's law describes the empirical regularity that the number of transistors on integrated circuits doubles approximately every two years. This advancement is important for other aspects of technological progress in computing – such as processing speed or the price of computers.

Transistor count

Moore's Law Is Dead. Now What?

Shrinking transistors have powered 50 years of advances in computing—but now other ways must be found to make computers more capable.

Moore's Law

From Wikipedia (Aug 2017)

....However, in April 2016, Intel CEO Brian Krzanich stated that "In my 34 years in the semiconductor industry, I have witnessed the advertised death of Moore's Law no less than four times. As we progress from 14 nanometer technology to 10 nanometer and plan for 7 nanometer and 5 nanometer and even beyond, our plans are proof that Moore's Law is alive and well".^[25] In January 2017, he declared that "I've heard the death of Moore's law more times than anything else in my career ... And I'm here today to really show you and tell you that Moore's Law is alive and well and flourishing."^[26]

Today hardware has to be designed in a [multi-core](#) manner to keep up with Moore's law. In turn, this also means that software has to be written in a [multi-threaded](#) manner to take full advantage of the hardware.

Moore's Law

(from Wikipedia)

Moore's law is the empirical observation that the complexity of integrated circuits, with respect to minimum component cost, doubles every 24 months[1]. It is attributed to Gordon E. Moore[2], a co-founder of Intel.

- Observation, not a physical law
- Often misinterpreted or generalized
- Many say it has been dead for several years
- Many say it will continue for a long while
- Not intended to be a long-term prophecy about trends in the semiconductor field
- Something a reporter can always comment about when they have nothing to say!

Device scaling, device count, circuit complexity, device cost, ... in leading-edge processes will continue to dramatically improve (probably nearly geometrically with a time constant of around 2 years) for the foreseeable future !!

Feature Size

The feature size of a process generally corresponds to the minimum lateral dimensions of the transistors that can be fabricated in the process

- Bounding region often a factor of 10 or more larger than area of transistor itself
- This along with interconnect requirements and sizing requirements throughout the circuit create an area overhead factor of 10x to 100x

Challenges

- Managing increasing device count
- Short lead time from conception to marketplace
- Process technology advances
- Device performance degradation
- Increasing variability
- Increasing pressure for cost reduction
- Power dissipation

Future Trends and Opportunities

- Is there an end in sight?

No ! But the direction the industry will follow is not yet known but the role semiconductor technology plays on society will increase dramatically!

- Will engineers trained in this field become obsolete at mid-career ?

No ! Engineers trained in this field will naturally evolve to support the microelectronics technology of the future. Integrated Circuit designers are now being trained to efficiently manage enormous levels of complexity and any evolutionary technology will result in even larger and more complexity systems with similar and expanded skills being required by the engineering community with the major changes occurring only in the details.

Future Trends and Opportunities

- Will engineers trained in this field be doing things the same way as they are now at mid-career?

No ! There have been substantive changes in approaches every few years since 1965 and those changes will continue. Continuing education to track evolutionary and revolutionary changes in the field will be essential to remain productive in the field.

- What changes can we expect to see beyond the continued geometric growth in complexity (capability) ?

That will be determined by the creativity and marketing skills of those who become immersed in the technology. New “Gordon Moores”, “Bill Gates” and “Jim Dells” will evolve.

Creation of Integrated Circuits

Most integrated circuits are comprised of transistors along with a small number of passive components and maybe a few diodes

This course will focus on understanding how transistors operate and on how they can be interconnected and possibly combined with a small number of passive components to form useful integrated circuits

Selected Semiconductor Company Profiles

(with Iowa ties)

Texas Instruments:

- World's largest producer of analog semiconductors at \$8.2B, over 100% larger than closest competitor
- Ranks 1st in DSP
- Ranks 9th in World in semiconductor sales

Number of employees: 30,000

2018 sales: \$15.80B

2018 income: \$5.6B

(after taxes)

Average annual sales/employee: \$474K

Average annual earnings/employee: \$187K

(data from TI quarterly reports)

(with Iowa ties)

Intel:

World's largest producer of semiconductors

Cofounders: Robert Noyce and Gordon Moore

Number of employees (2019) : 110,000

2018 sales: \$71B

2018 income: \$21B

Average annual sales/employee: \$645K

Average annual earnings/employee: \$190K

Robert Noyce
BA Grinnell 1949

Noyce is also the co-inventor of the integrated circuit !

Selected Semiconductor Company Profiles

(with Iowa ties)

Marvell:

Cofounders: Sehat Sutardja (CEO), Welli Dai and Pantas Sutardja

Number of employees: 5200

2018 sales: \$2.9B

2018 income: \$520M

Average annual sales/employee: \$513K

Average annual earnings/employee: \$100K
