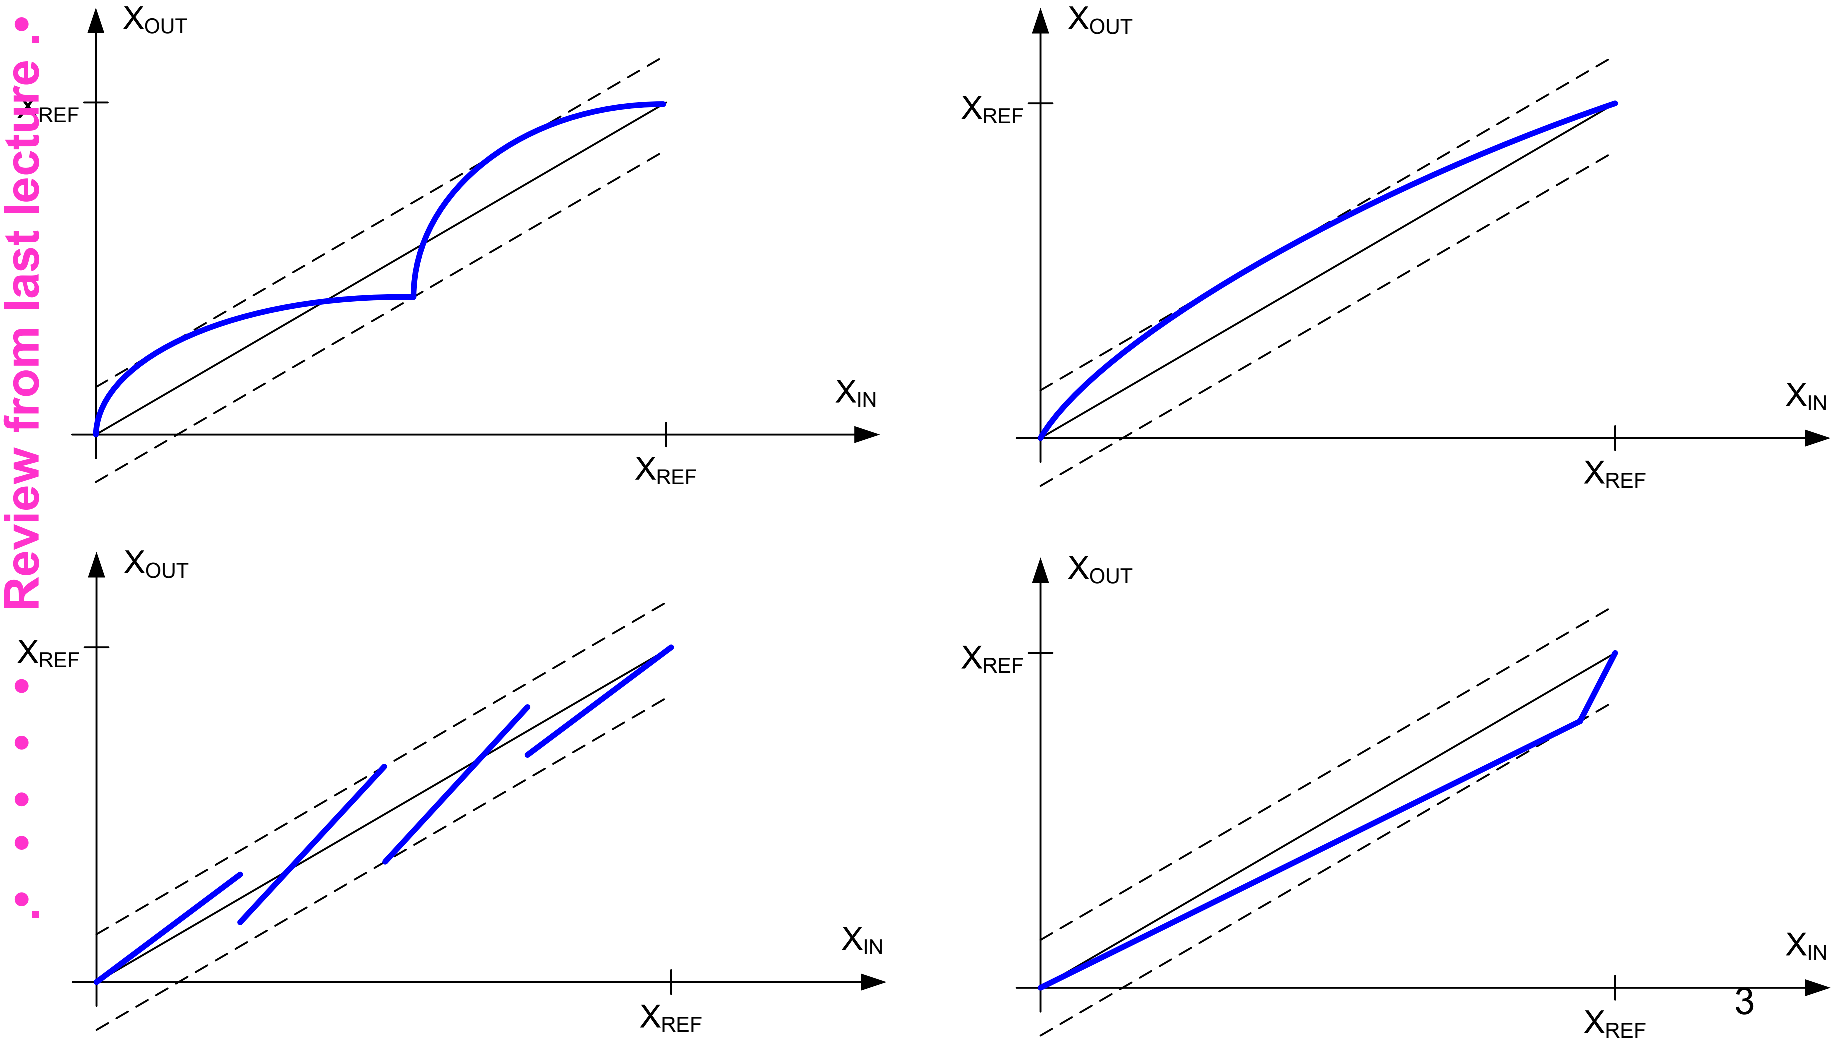
INL Often Not a Good Measure of Linearity

Four identical INL with dramatically different linearity



Review from last lecture

Distortion Analysis

How are spectral components determined?

By integral

$$A_k = \frac{1}{\omega T}\left(\int_{t_1}^{t_1+T} f(t)e^{-jk\omega t}dt + \int_{t_1}^{t_1+T} f(t)e^{jk\omega t}dt\right)$$

or

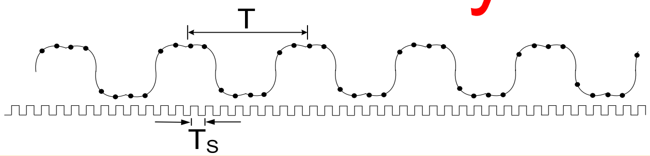
$$a_k = \frac{2}{\omega T}\int_{t_1}^{t_1+T} f(t)\sin(kt\omega)dt \qquad b_k = \frac{2}{\omega T}\int_{t_1}^{t_1+T} f(t)\cos(kt\omega)dt$$

Integral is very time consuming, particularly if large number of components are required

By DFT (with some restrictions that will be discussed)

By FFT (special computational method for obtaining DFT)

Why is this a Key Theorem?



$$x(t) = A_0 + \sum_{k=1}^{h-1} A_k \sin(k\omega t + \theta_k)$$

Review from last lecture

THEOREM: Consider N samples of a periodic signal with period T=1/f and sampling period $T_S=1/f_S$. If N_P is an integer, x(t) is band limited to f_{MAX}, and $f_s>2f_{max}$, then

$$|A_m| = \frac{2}{N}\left|X(mN_P+1)\right| \qquad 0 \le m \le h-1$$

and $X(k)=0$ for all k not defined above

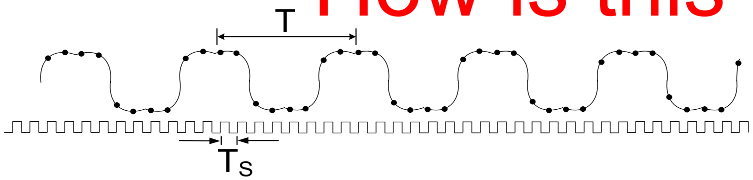
where $\langle X(k)\rangle_{k=0}^{N-1}$ is the DFT of the sequence $\langle x(kT_S)\rangle_{k=0}^{N-1}$

$\langle A_k \rangle$ are the Fourier Series Coefficients, N_P is the number of periods, and

$$h = \text{Int}\left(\frac{f_{MAX}}{f} - \frac{1}{N_P}\right)$$

- DFT requires dramatically less computation time than the integrals for obtaining Fourier Series coefficients
- Can easily determine the sampling rate (often termed the Nyquist rate) to satisfy the band limited part of the theorem
- If “signal” is output of a system (e.g. ADC or DAC), f_{MAX} is independent of f

How is this theorem abused?



$$x(t) = A_0 + \sum_{k=1}^{h-1} A_k \sin(k\omega t + \theta_k)$$

Review from last lecture .

THEOREM: Consider N samples of a periodic signal with period T=1/f and sampling period $T_S=1/f_S$. If N_P is an integer, x(t) is band limited to f_{MAX}, and $f_s>2f_{max}$, then

$$|A_m| = \frac{2}{N}|X(mN_P+1)| \qquad 0 \le m \le h-1$$

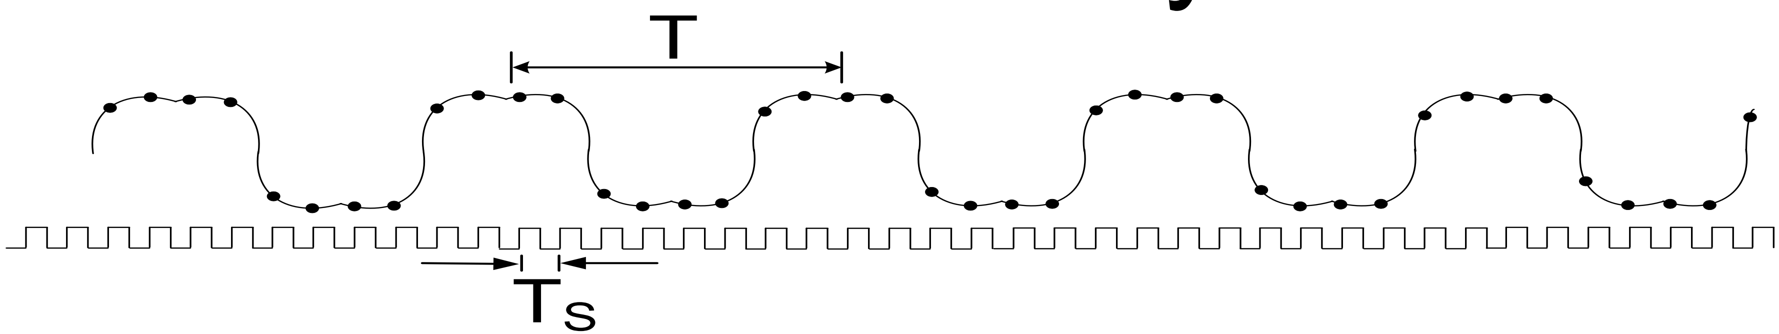
and $X(k)=0$ for all k not defined above

where $\langle X(k)\rangle_{k=0}^{N-1}$ is the DFT of the sequence $\langle x(kT_S)\rangle_{k=0}^{N-1}$

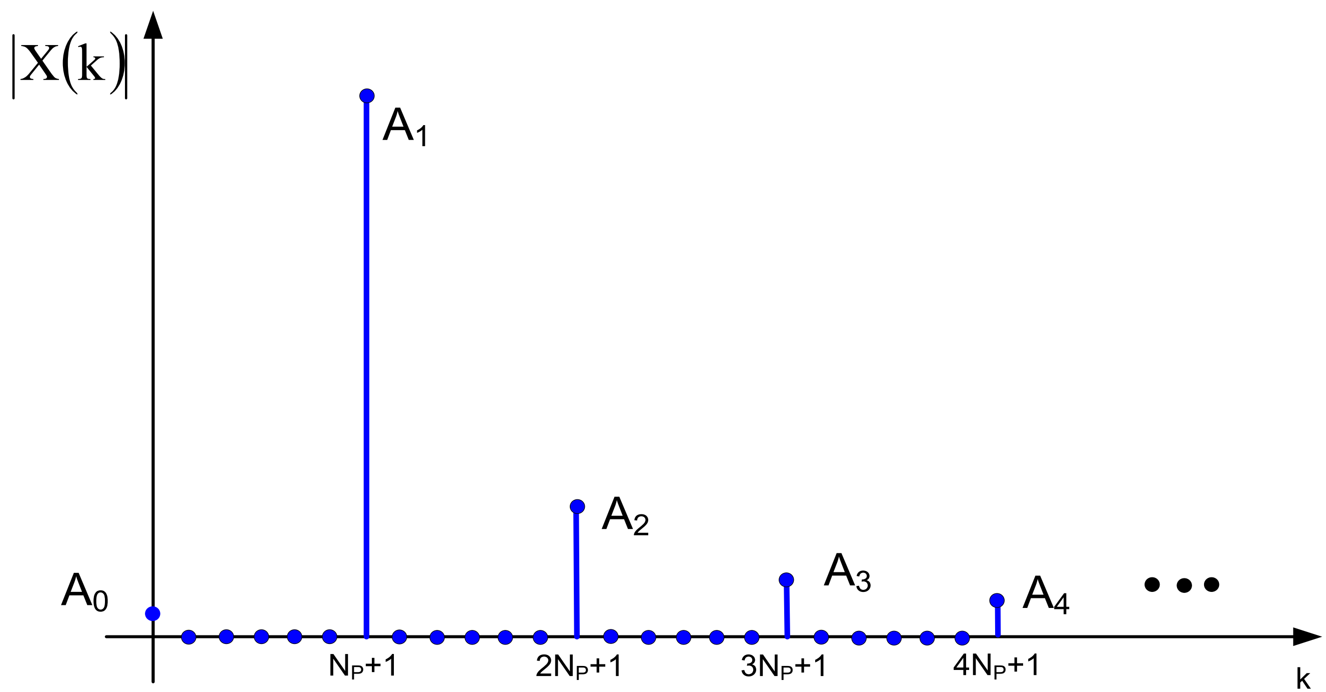
$\langle A_k \rangle$ are the Fourier Series Coefficients, N_P is the number of periods, and $h = \mathrm{Int}\left(\frac{f_{MAX}}{f} - \frac{1}{N_P}\right)$

- Much evidence of engineers attempting to use the theorem when N_P is not an integer
- Challenging to have N_P an integer in practical applications
- Dramatic errors can result if there are not exactly an integer number of periods in the sampling window

Distortion Analysis



If the hypothesis of the theorem are satisfied, we thus have



Review from last lecture

Question: How much noise is in the computational environment?

Assume A_k = -310 dB for $0 \le k \le N$

$$A_{kdB} = 20\log10A_k \Longrightarrow A_k = 10^{\frac{A_{kDB}}{20}}$$

$$A_k \cong 10^{\frac{-310}{20}} = 10^{-15.5} \overset{defn}{=} \bar{A}$$

$$V_{Noise,RMS} \cong \sqrt{\sum_{k=1}^{N-1}\left(\frac{A_k}{\sqrt{2}}\right)^2} \overset{\substack{A_k=\bar{A} \\ N\ \text{large}}}{=} \bar{A}\sqrt{\frac{N}{2}}$$

$$V_{Noise,RMS} \cong \bar{A}\sqrt{\frac{N}{2}} = 10^{-15.5}\sqrt{\frac{512}{2}} = 5.1 \bullet 10^{-15} \cong 5fV$$

This computational environment has a very low total computational noise and does not become significant until the 46-bit resolution level is reached !!

Considerations for Spectral Characterization

- Tool Validation
- DFT Length and NP
- Importance of Satisfying Hypothesis
- Windowing

Considerations for Spectral Characterization

DFT Length and NP

- DFT Length and NP do not affect the computational noise floor

- Although not shown here yet, DFT length does reduce the quantization noise floor coefficients but not total quantization noise

Considerations for Spectral Characterization

- Tool Validation

- DFT Length and NP

- Importance of Satisfying Hypothesis
  - NP is an integer
  - Band-limited excitation

- Windowing

Considerations for Spectral Characterization

- Windowing

DFT Examples

Recall the theorem that provided for the relationship between the DFT terms and the Fourier Series Coefficients required

1. The sampling window must be an integral number of periods
2. $N > \dfrac{2\, f_{max}}{f_{SIGNAL}} N_P$

Example

WLOG assume f_{SIG}=50Hz

$$V_{IN} = \sin(\omega t) + 0.5\sin(2\omega t)$$

$$\omega = 2\pi f_{SIG}$$

Consider N_P=20.2 N=4096

Recall $20\log_{10}(0.5)=-6.0205999$

- More importantly, substantial raise in the computational noise floor !!! (from over -300dB to only -80dB)
- Errors at about the 13-bit level !

DFT Examples

Recall the theorem that provided for the relationship between the DFT terms and the Fourier Series Coefficients required

1. The sampling window be an integral number of periods

2. Sampling rate > Nyquist rate

$$\left.\begin{array}{l} f_{SAMP} > f_{NYQUIST} = 2f_{MAX} \\ NT_{SAMP} = N_P T_{SIG} \end{array}\right\} \Longrightarrow \quad N > \frac{2f_{max}}{f_{SIGNAL}} N_P$$

Example $N < \frac{2f_{\max}}{f_{SIGNAL}} N_P$ (Not meeting Nyquist sampling rate requirement)

If f_{SIG}=50Hz

and N_P=20 N=512

$$N < \frac{2f_{\max}}{f_{SIGNAL}} N_P \quad \Rightarrow \quad f_{max} < 640\text{Hz}$$

Example

$$N < \frac{2f_{max}}{f_{SIGNAL}} N_P$$

(Not meeting Nyquist sampling rate requirement)

Consider $N_P=20$ $N=512$

If $f_{SIG}=50\text{Hz}$ but an additional input at 700Hz is present

$$N_P = \frac{NT_S}{T} \quad \leftrightarrow \quad f_{SAMP} = f_{SIGNAL}\frac{N}{N_P} \qquad f_{SAMP} = 1.280KHz$$

$$V_{IN} = \sin(\omega t) + 0.5\sin(2\omega t) + 0.5\sin(14\omega t)$$

$$\omega = 2\pi f_{SIG}$$

(i.e. the component at 700 Hz which violates the band limit requirement – Nyquist rate for the 700 Hz input is 1.4KHz)

Recall $20\log_{10}(0.5)=-6.0205999$

Effects of High-Frequency Spectral Components

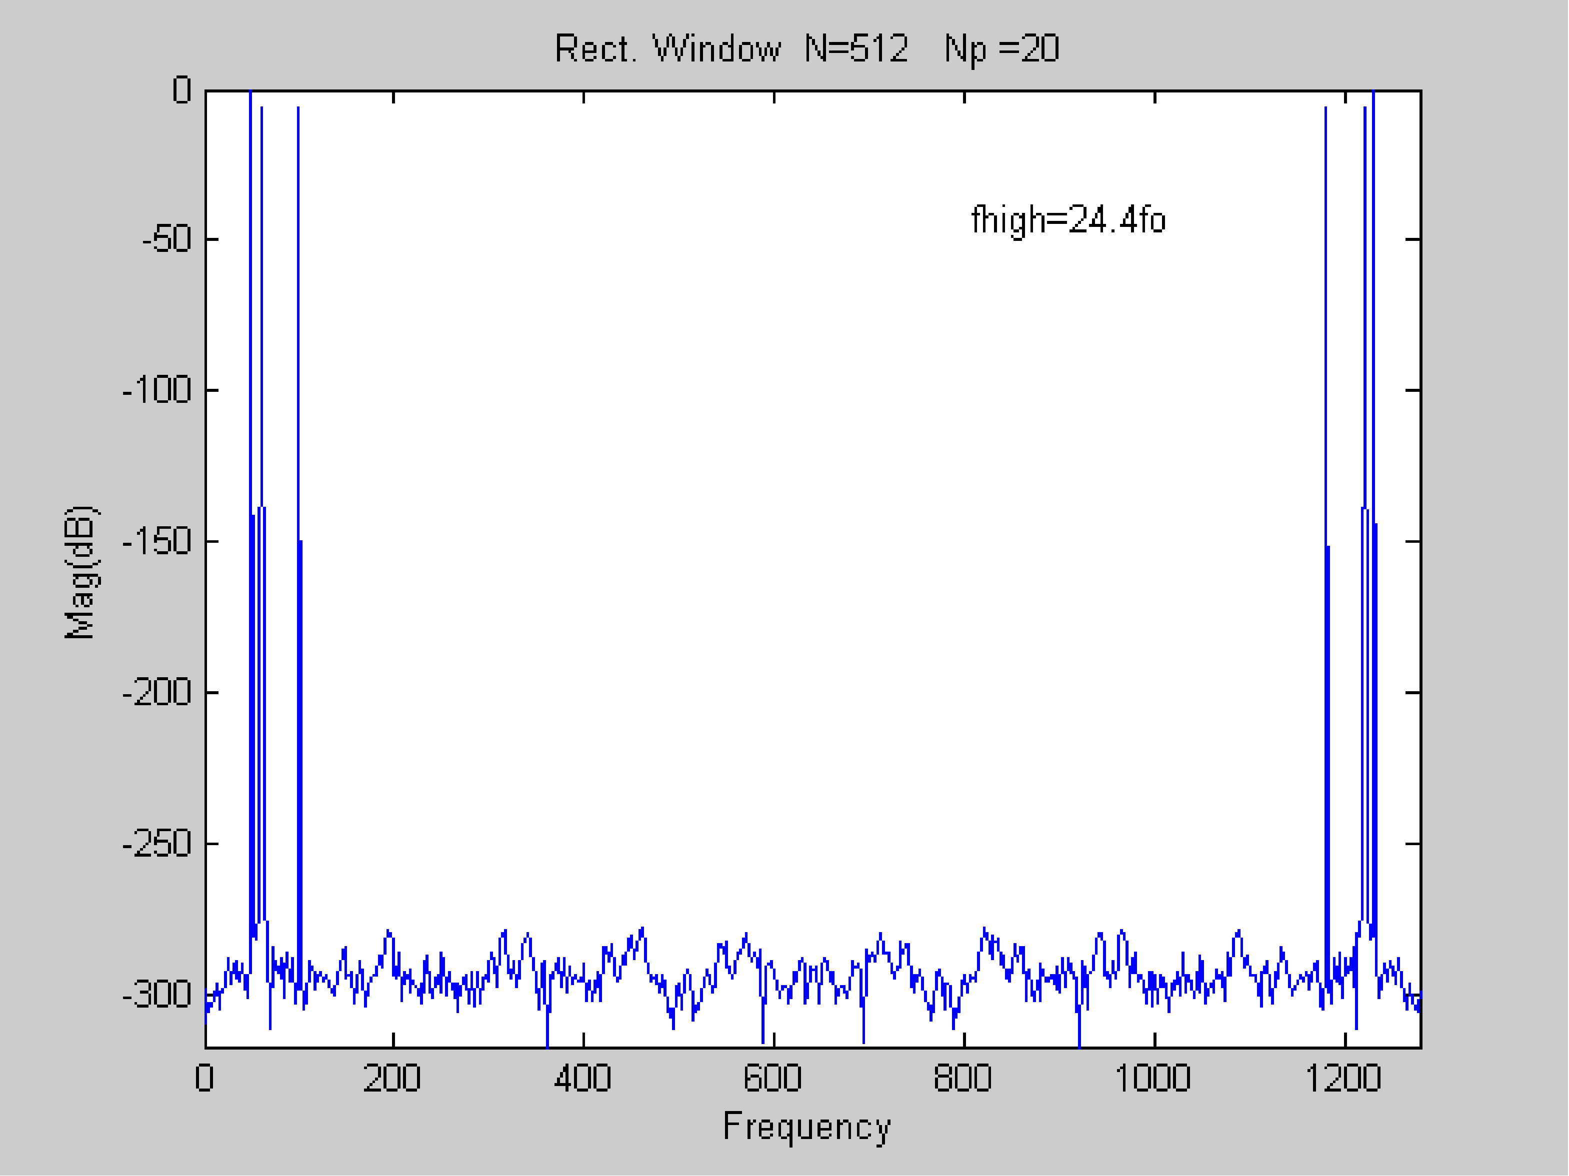
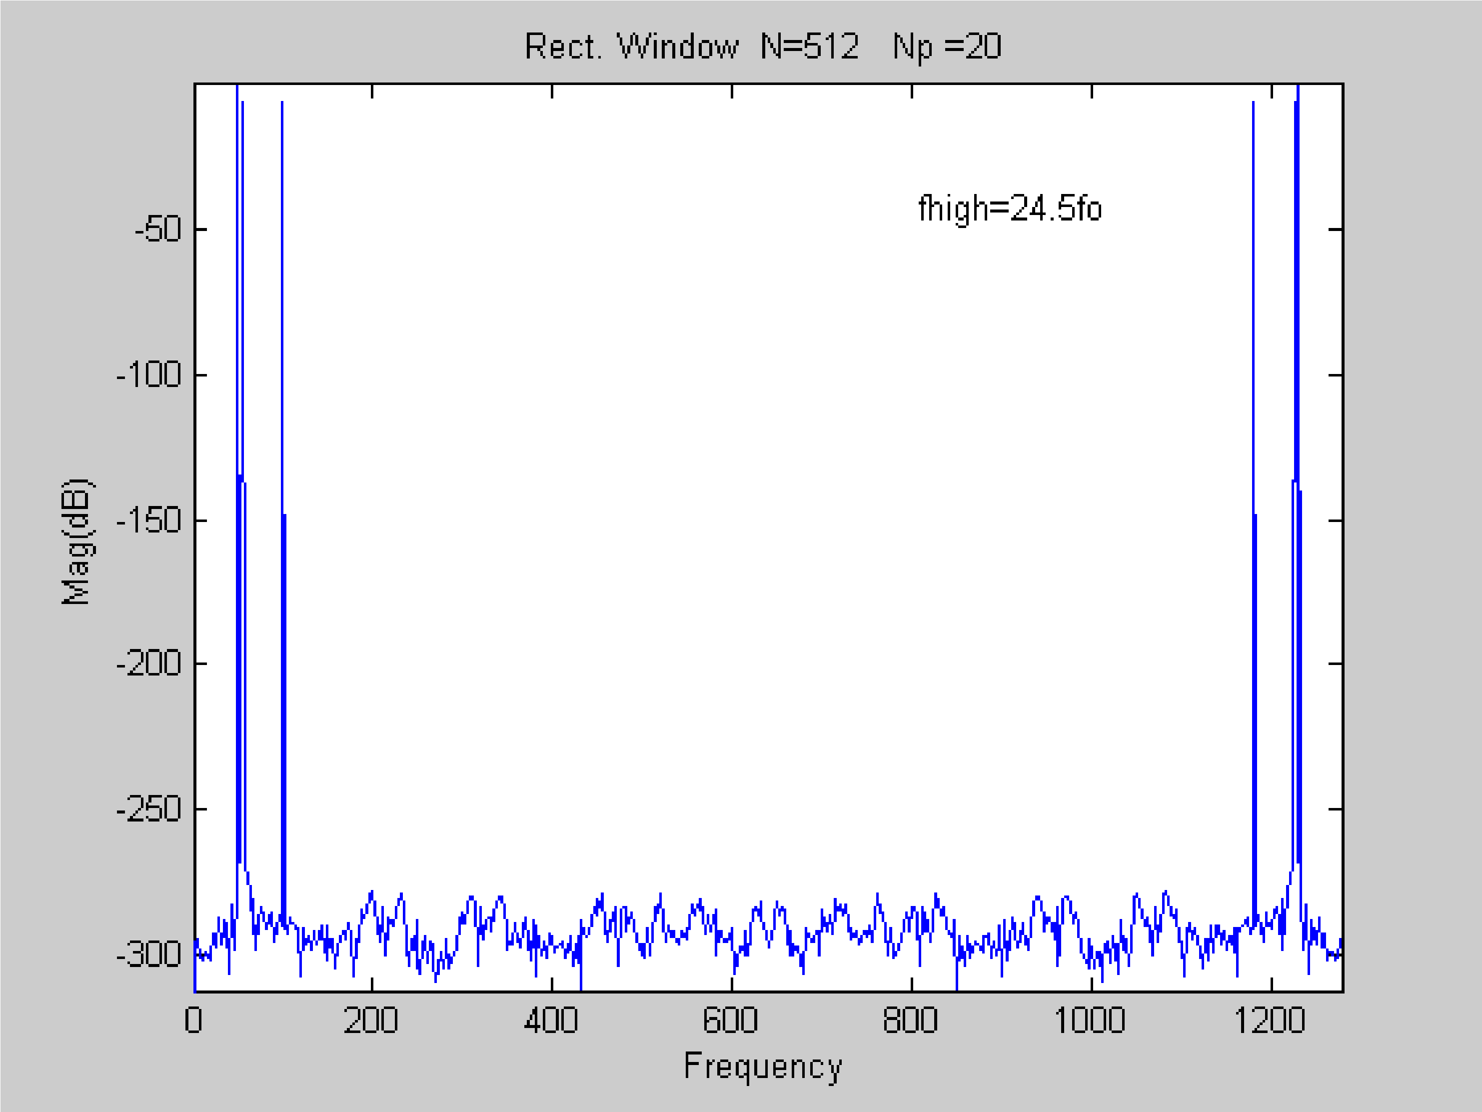
(zoomed in around fundamental)

Effects of High-Frequency Spectral Components



Effects of High-Frequency Spectral Components



Observations

- Aliasing will occur if the band-limited part of the hypothesis for using the DFT is not satisfied
- Modest aliasing will cause high frequency components that may or may not appear at a harmonic frequency
- More egregious aliasing can introduce components near or on top of fundamental and lower-order harmonics
- Important to avoid aliasing if the DFT is used for spectral characterization

Review Questions

Q1: How many DFT terms are there if the sample window is of length 4096?

A: 4096

Q2: When the magnitude of the DFT coefficients are plotted, the horizontal axis is an index axis (i.e. dimensionless) but often the index terms are labeled as frequency terms. If the sampling frequency is f_s and N samples are taken, what is the frequency of the first DFT term? What is the frequency of the 2^{nd} DFT term?

A: 0 Hz   A: fs/N

Q3: If samples of the time-domain signal are made over exactly 31 periods, which index term corresponds to the fundamental? To the second harmonic?

A: 32^{nd} term   A: 63^{rd} term

Q4: What is the difference between the DFT and the FFT**?**

A: FFT is a computationally efficient method of computing the DFT

Q5: True or False: The DFT terms are real numbers.

A: False   We are, however, often interested most in the magnitude of the DFT terms and these are real

Q6: True or False: The magnitude of the DFT terms are symmetric around index number N/2.   A: Yes

Considerations for Spectral Characterization

- Tool Validation
- DFT Length and NP
- Importance of Satisfying Hypothesis
  - NP is an integer
  - Band-limited excitation
- Windowing

Considerations for Spectral Characterization

- Tool Validation
- DFT Length and NP
- Importance of Satisfying Hypothesis
  - NP is an integer
  - Band-limited excitation
- Windowing

Are there any strategies to address the problem of requiring precisely an integral number of periods to use the FFT?

Windowing is sometimes used

Windowing is sometimes misused

Windowing

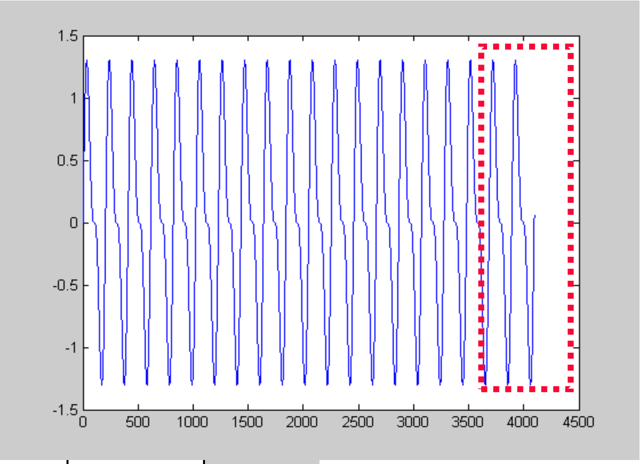
Windowing is the weighting of the time domain function to maintain continuity at the end points of the sample window

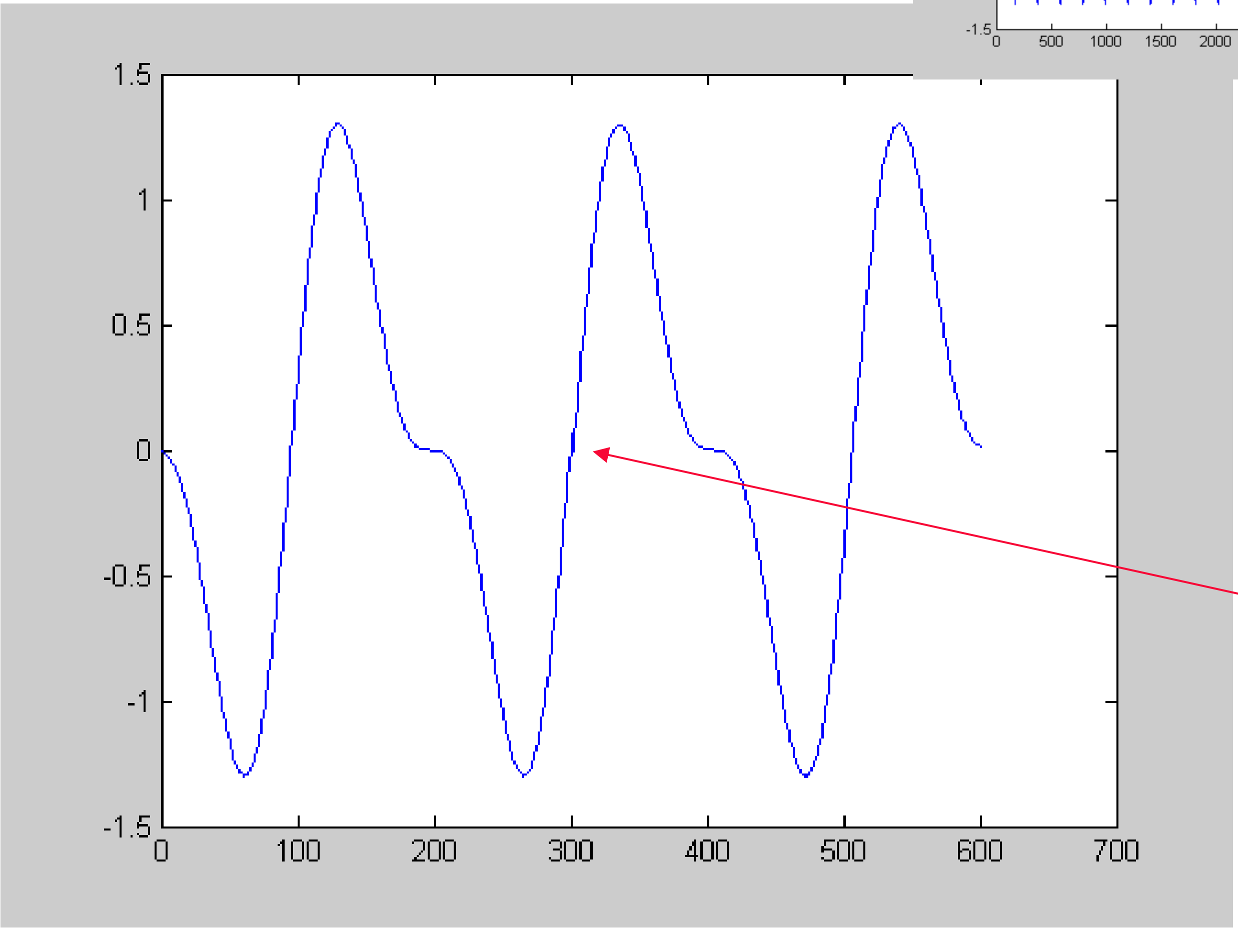
Well-studied window functions:

- Rectangular (also with appended zeros)
- Triangular
- Hamming
- Hanning
- Blackman

Recall

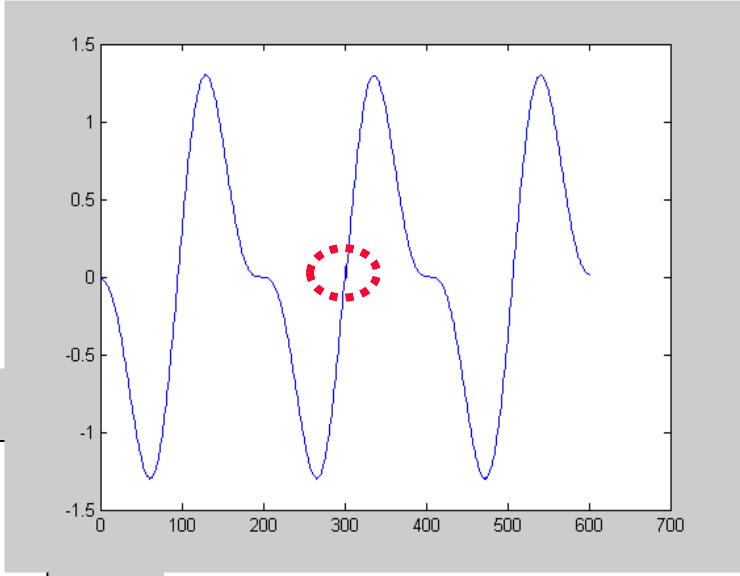
Input Waveform

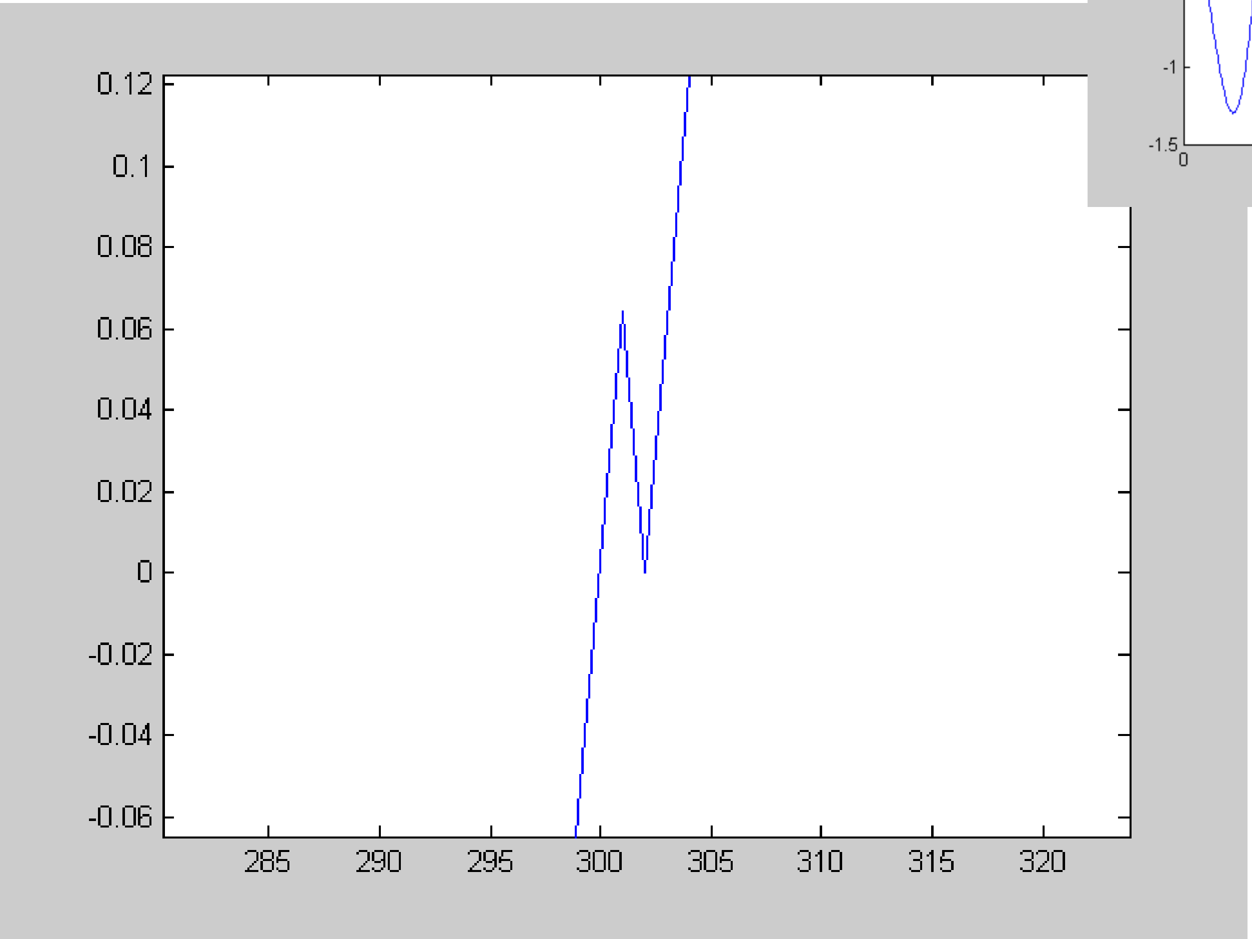




Recall

Input Waveform





Rectangular Window

Sometimes termed a boxcar window

Uniform weight

Can append zeros

Without appending zeros equivalent to no window

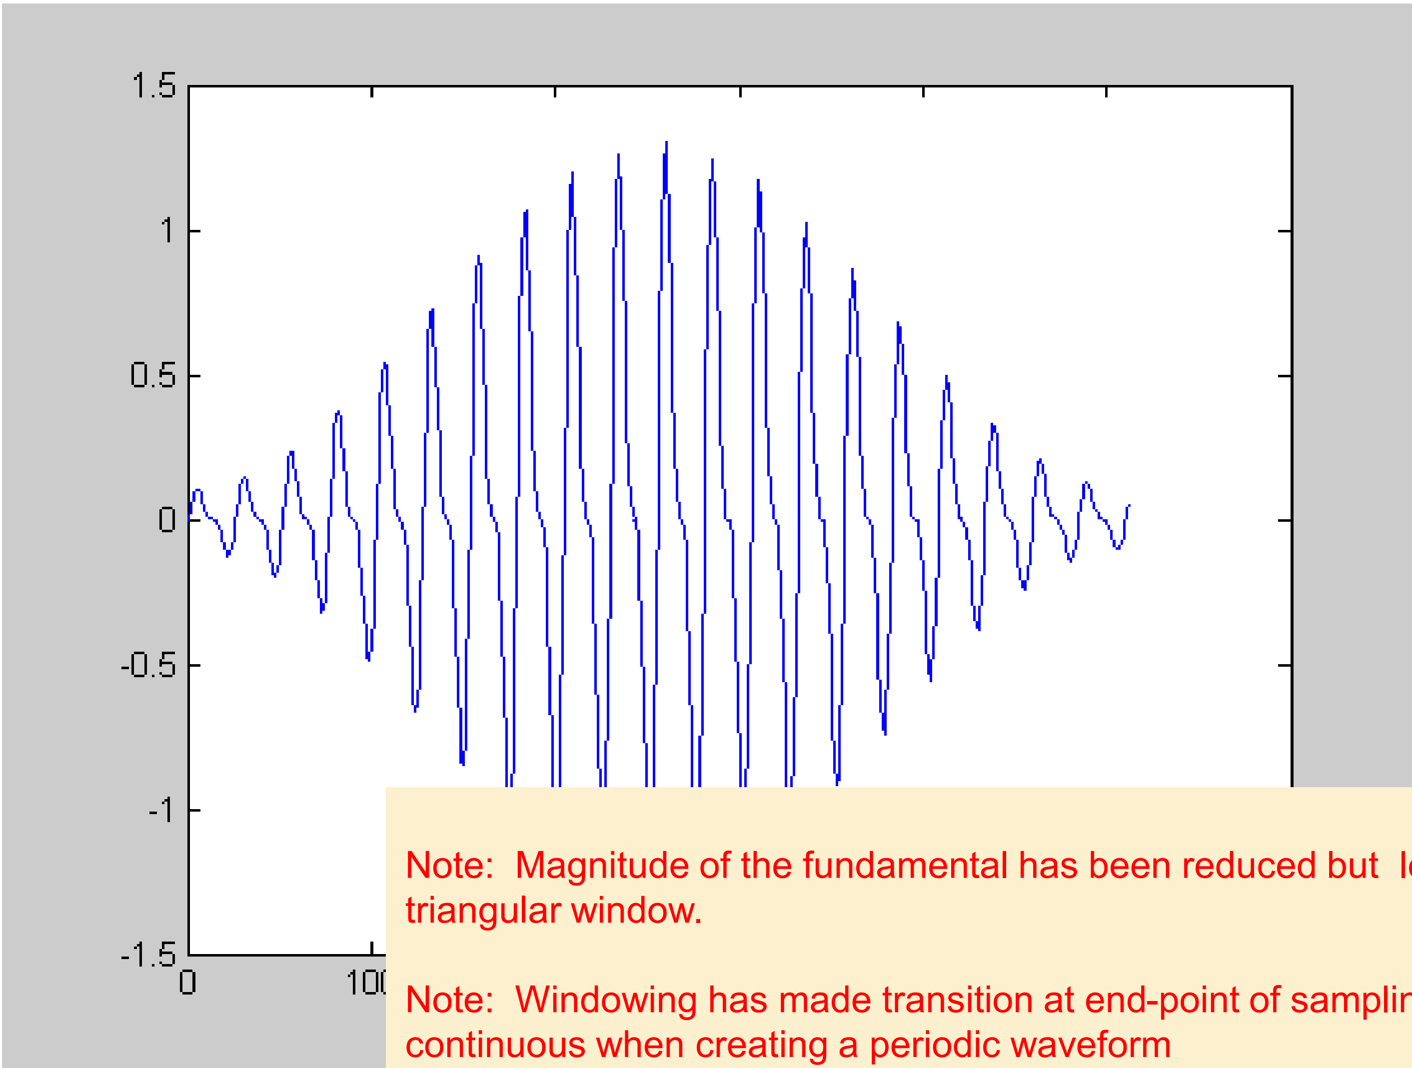
Note: Magnitude of the fundamental has been reduced but the skirting effects have also been reduced.

Note: Windowing has reduced energy in the signal but also made transition at end-point of sampling window continuous when creating a periodic waveform

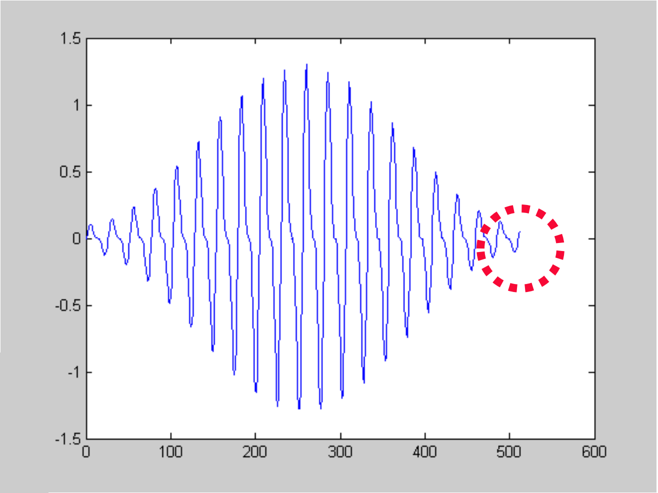
Hamming Window

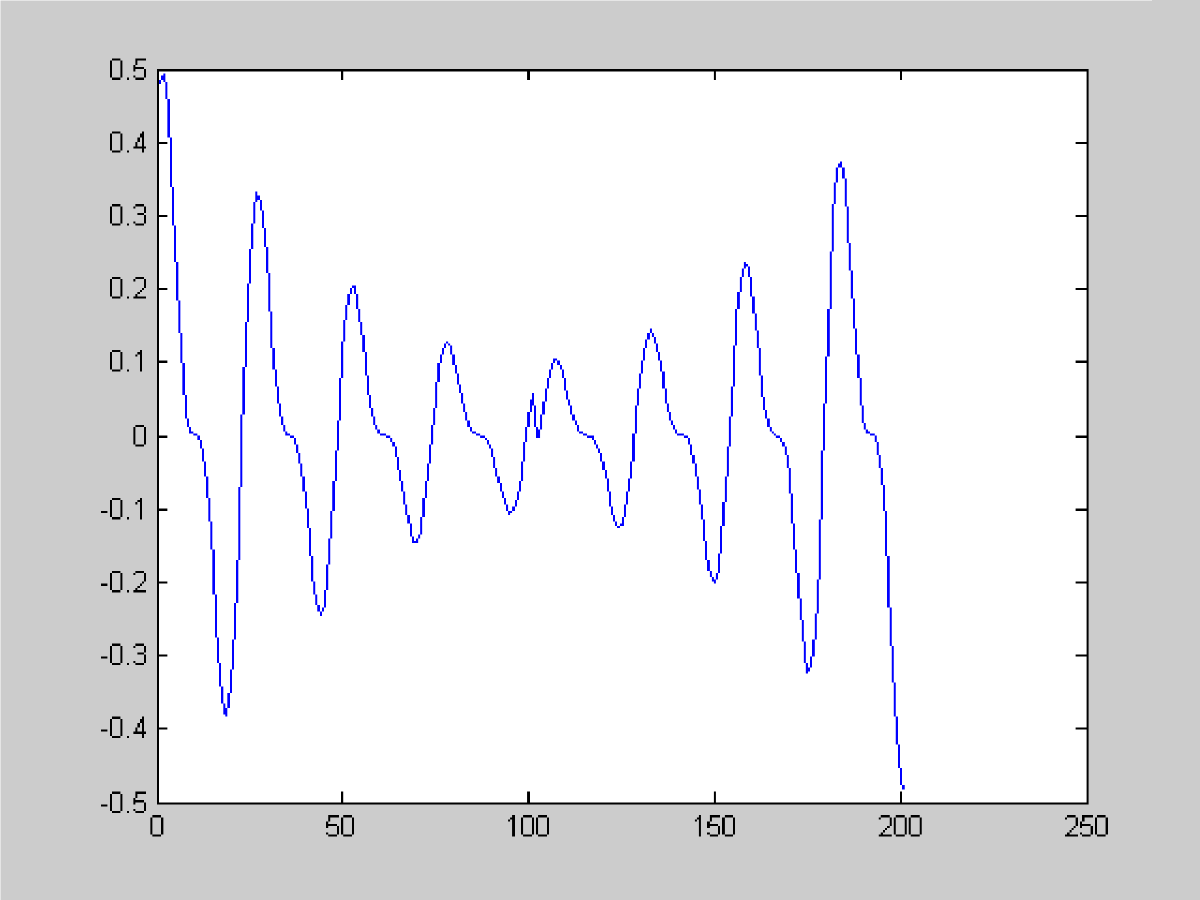


Note: Magnitude of the fundamental has been reduced but less than for triangular window.

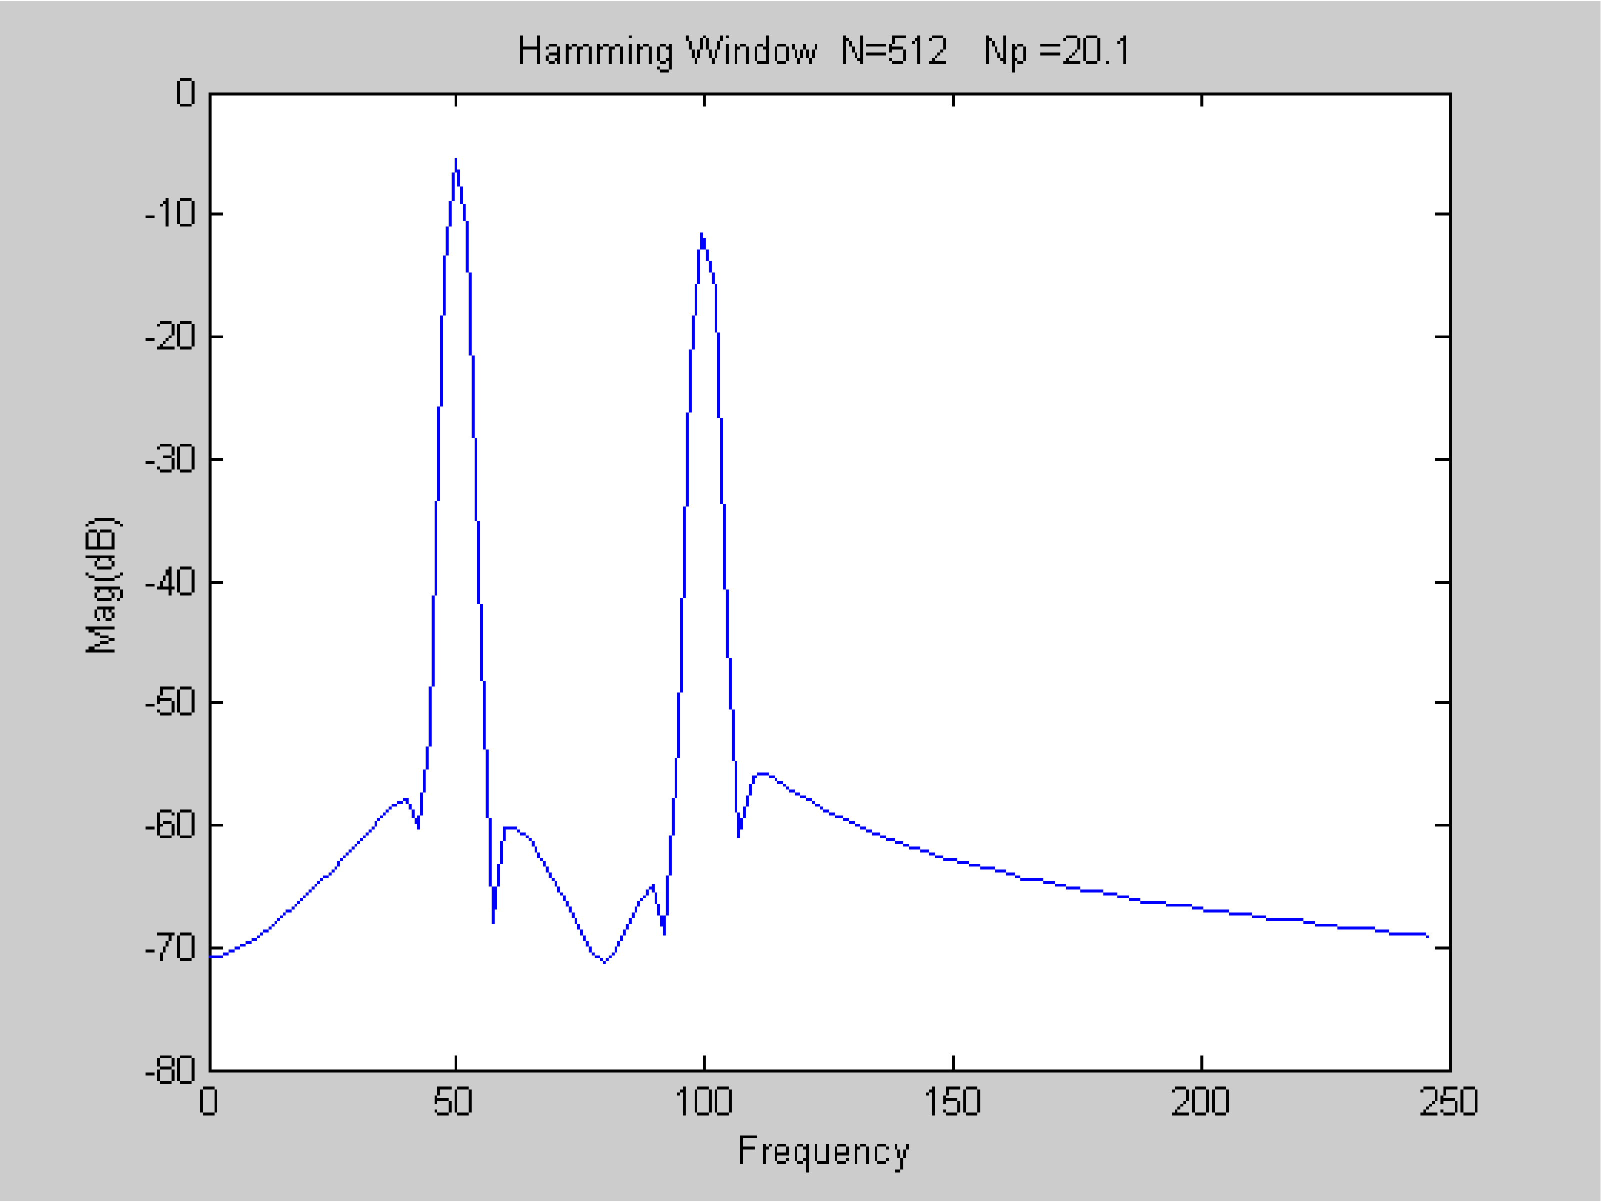
Note: Windowing has made transition at end-point of sampling window continuous when creating a periodic waveform

Hamming Window



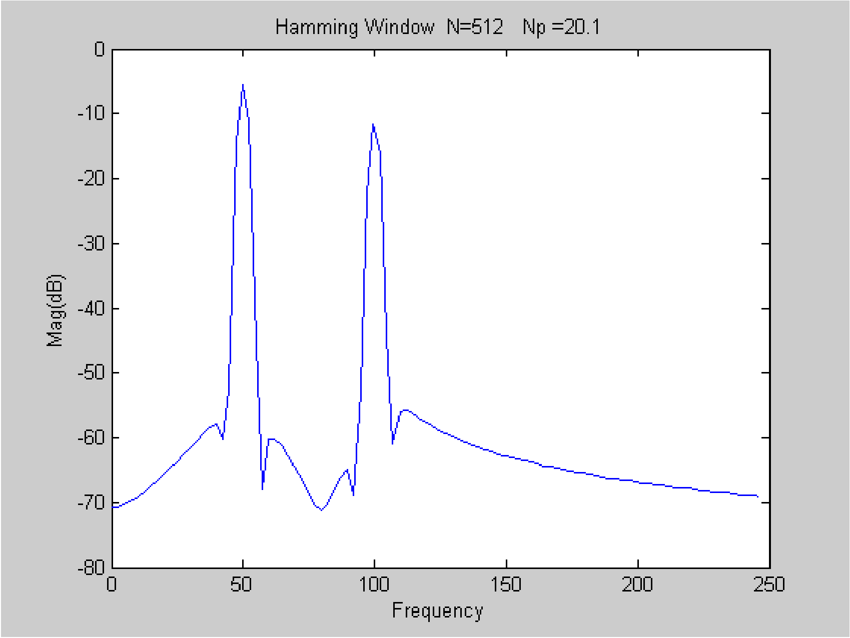


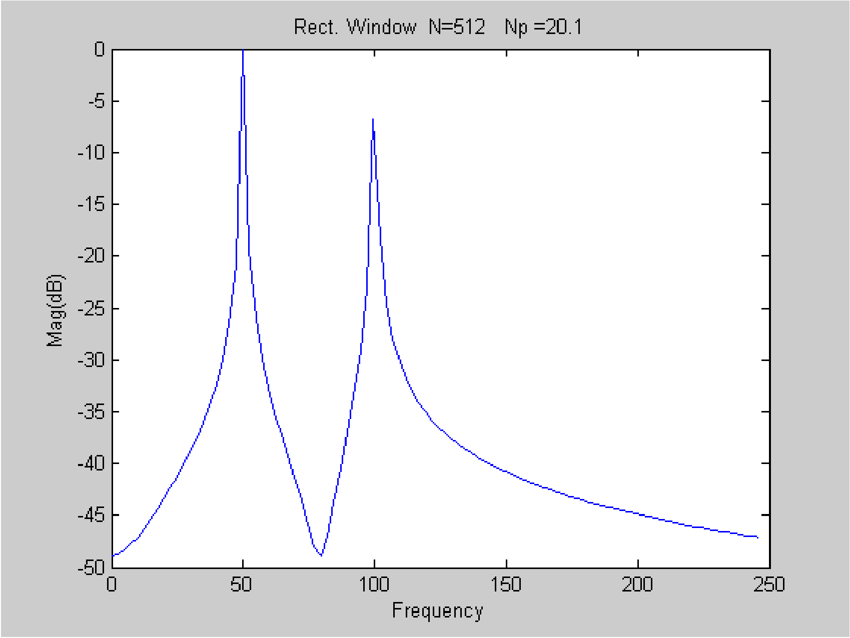
Spectral Response with Non-Coherent Sampling and Windowing



(zoomed in around fundamental)

Comparison with Rectangular Window





Note: Vertical axis are different

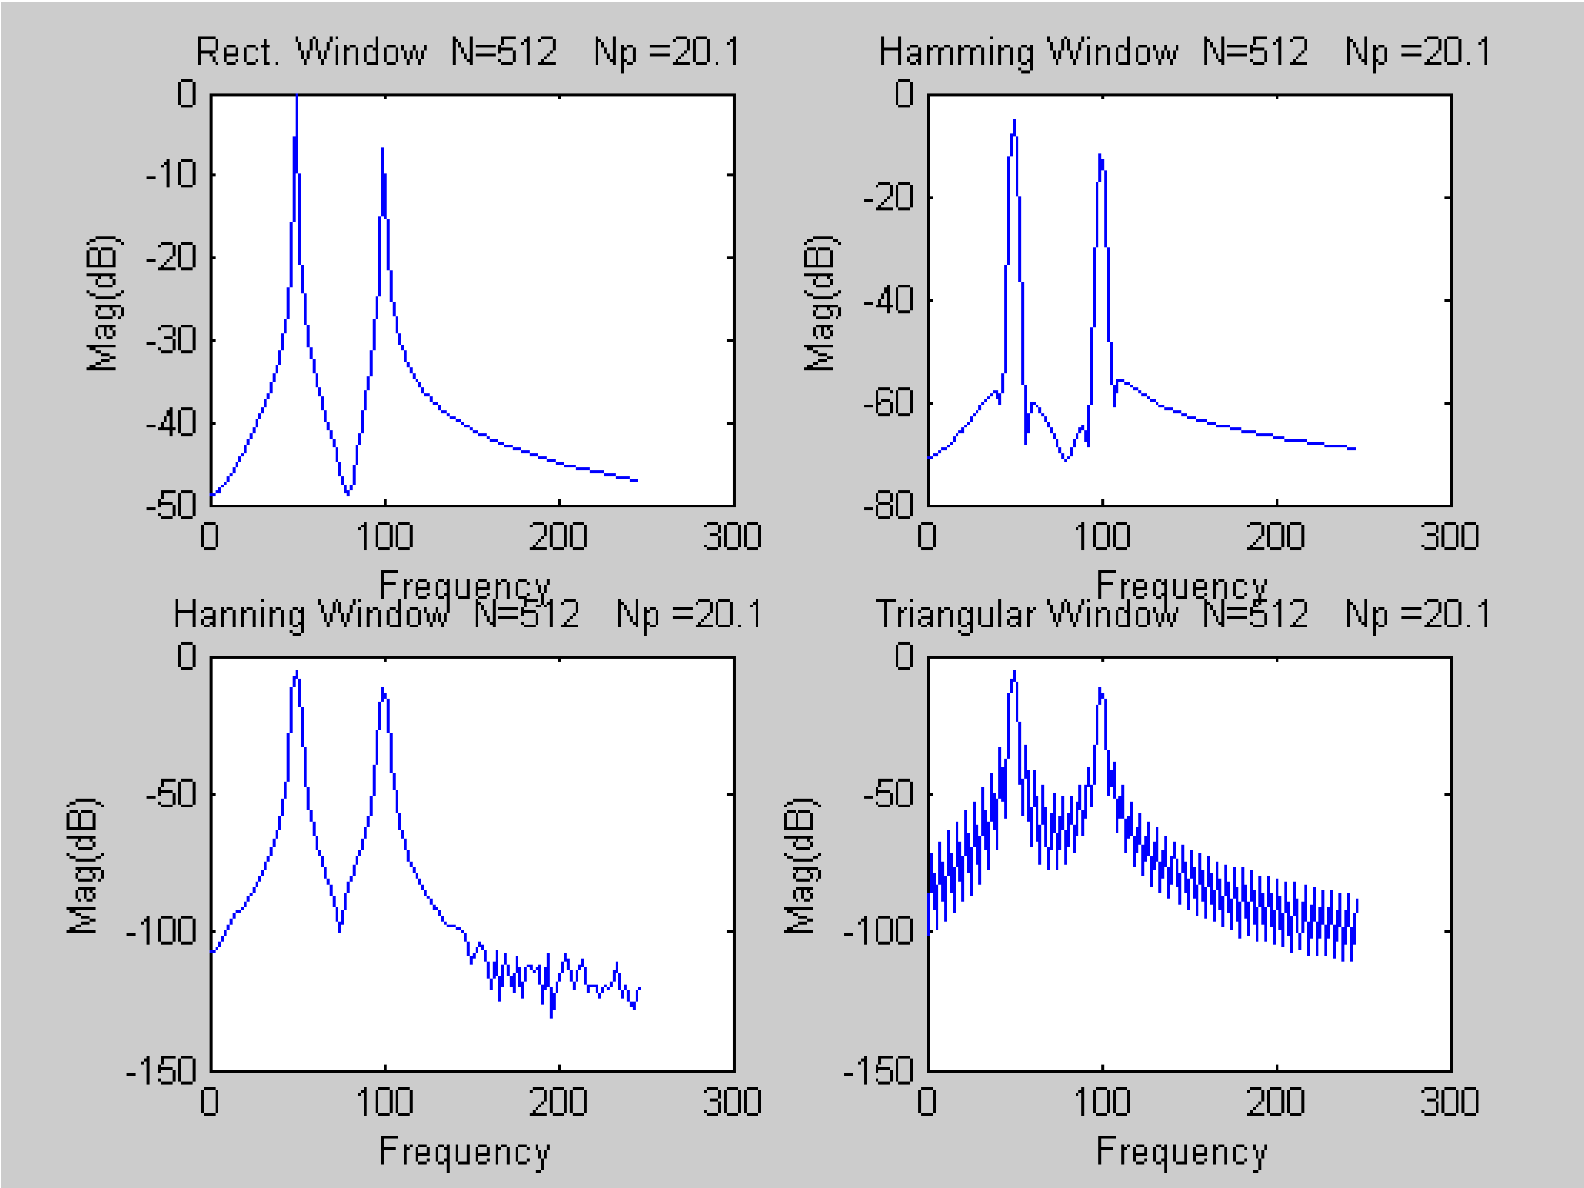
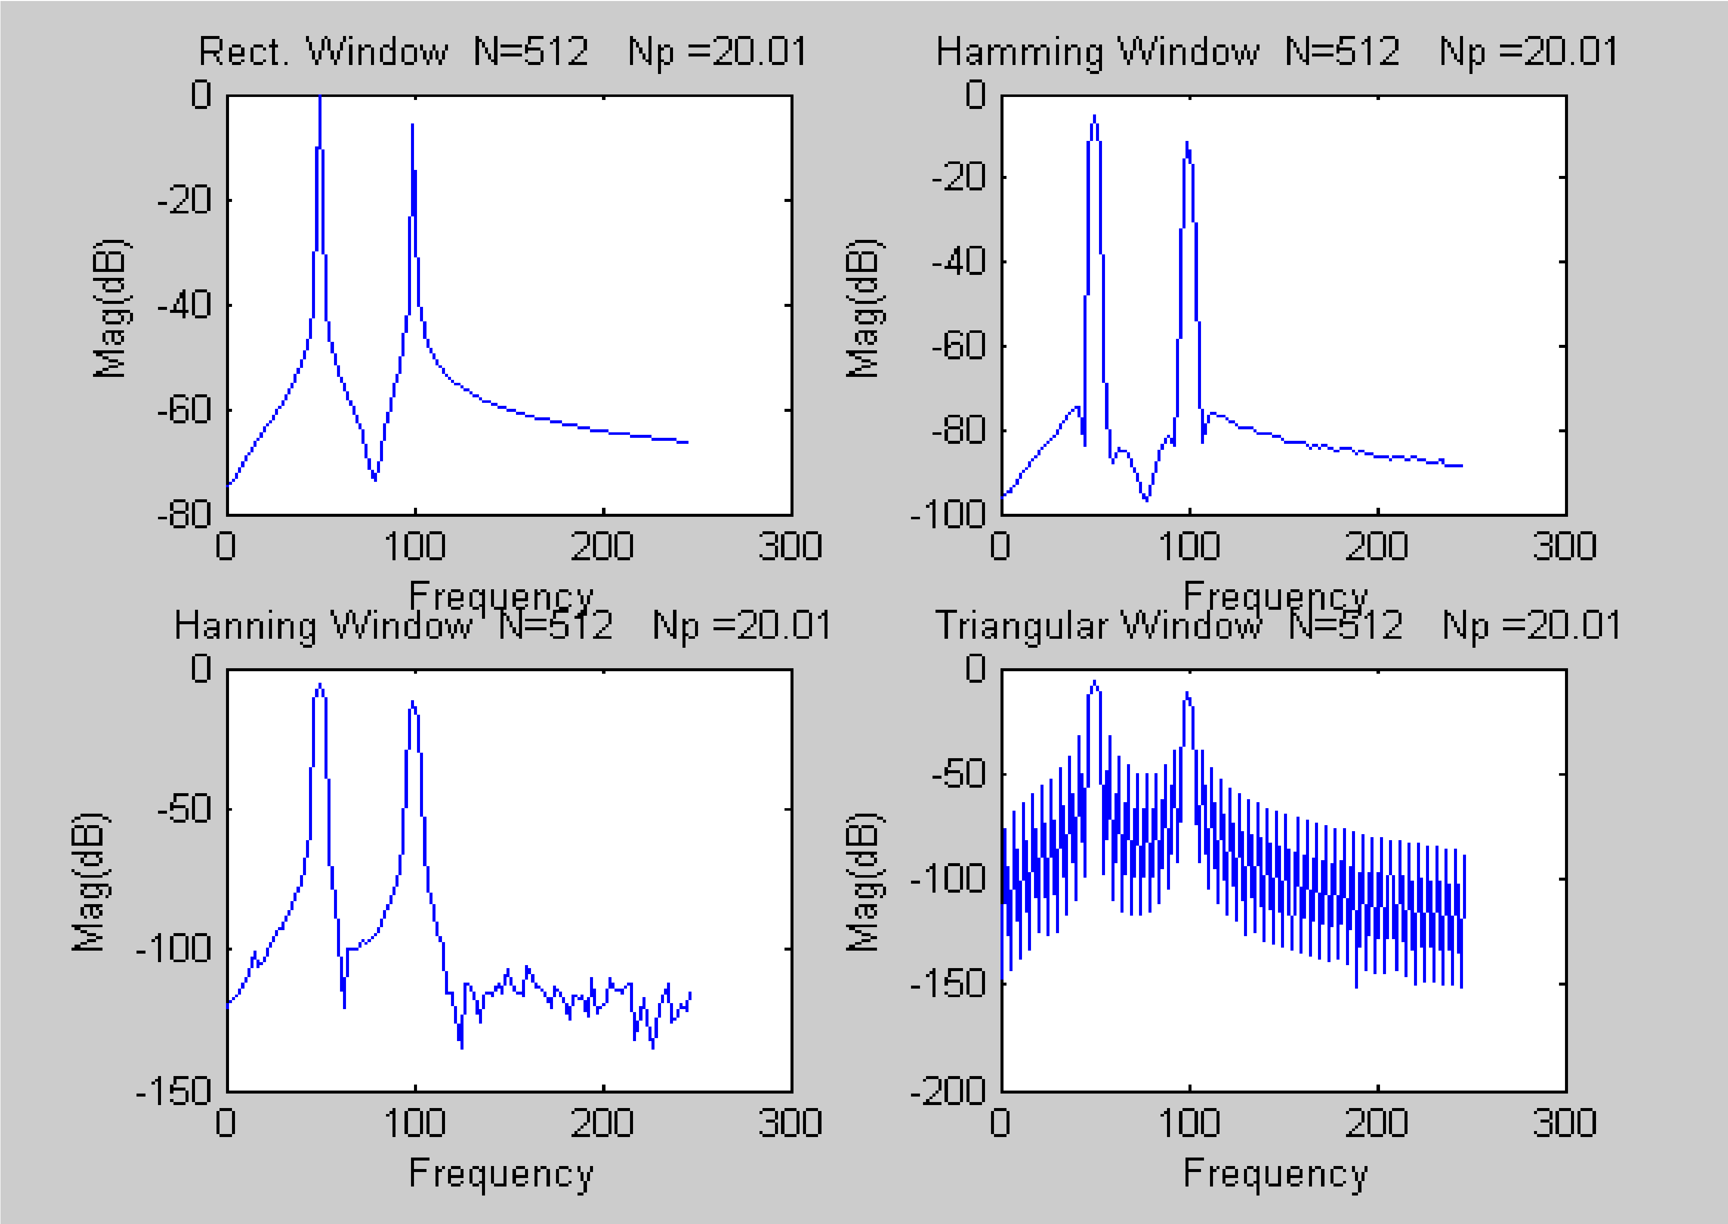
Comparison of 4 windows



Comparison of 4 windows

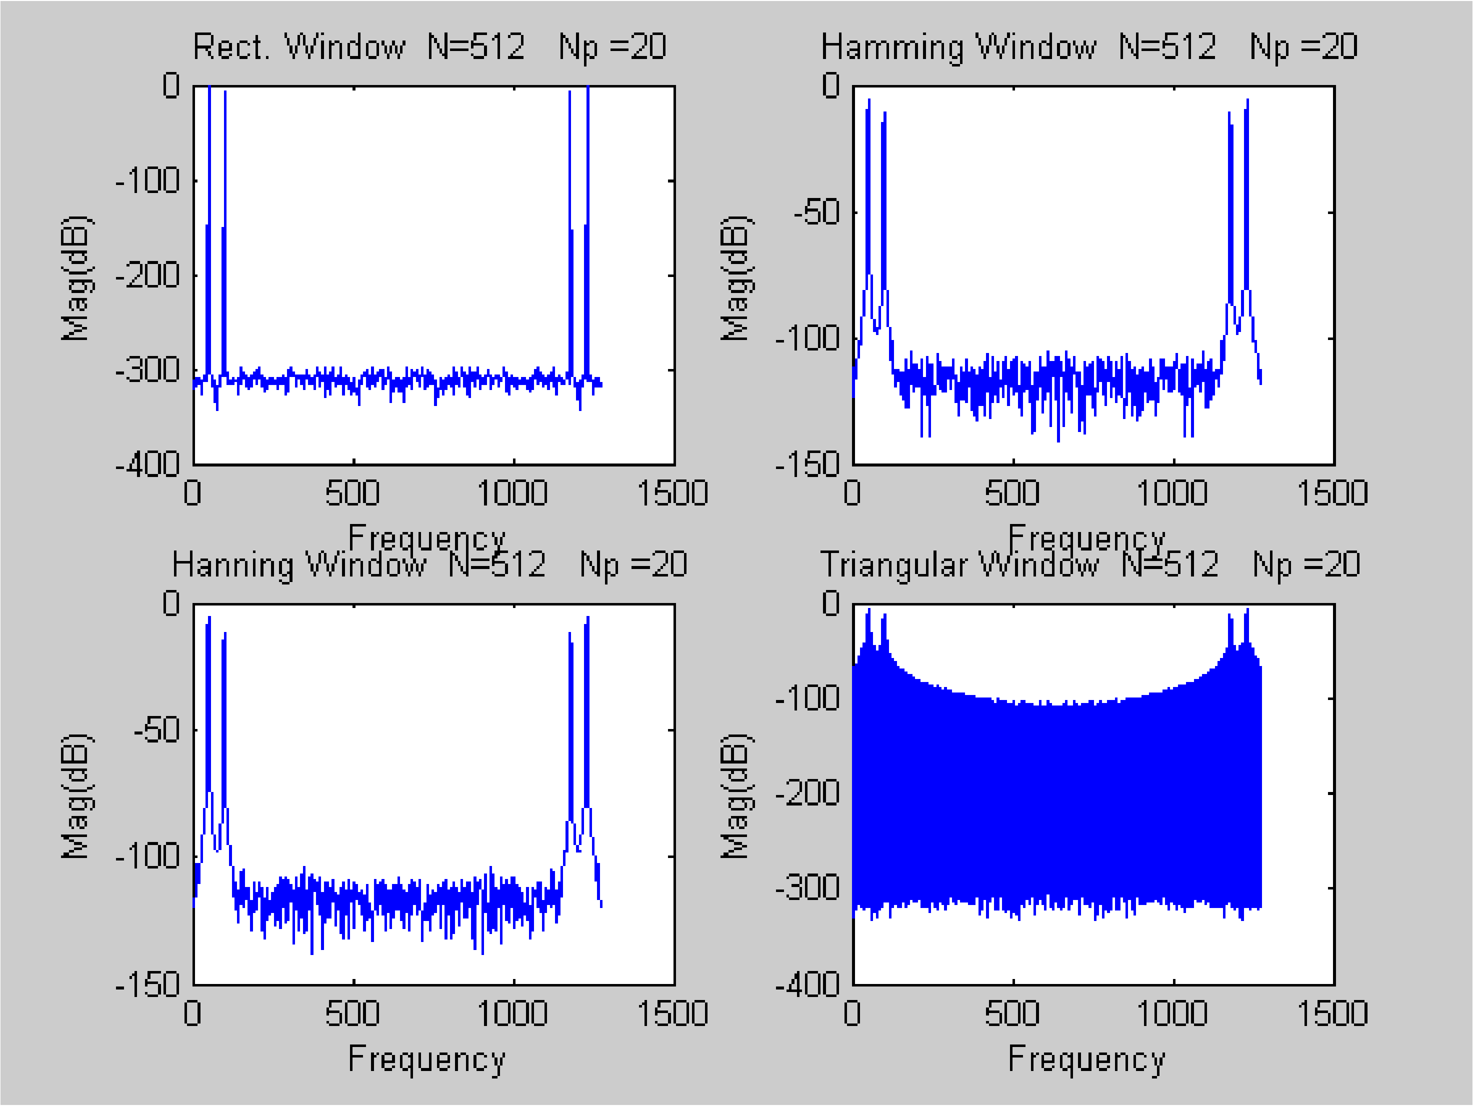


But windows can make things worse too!

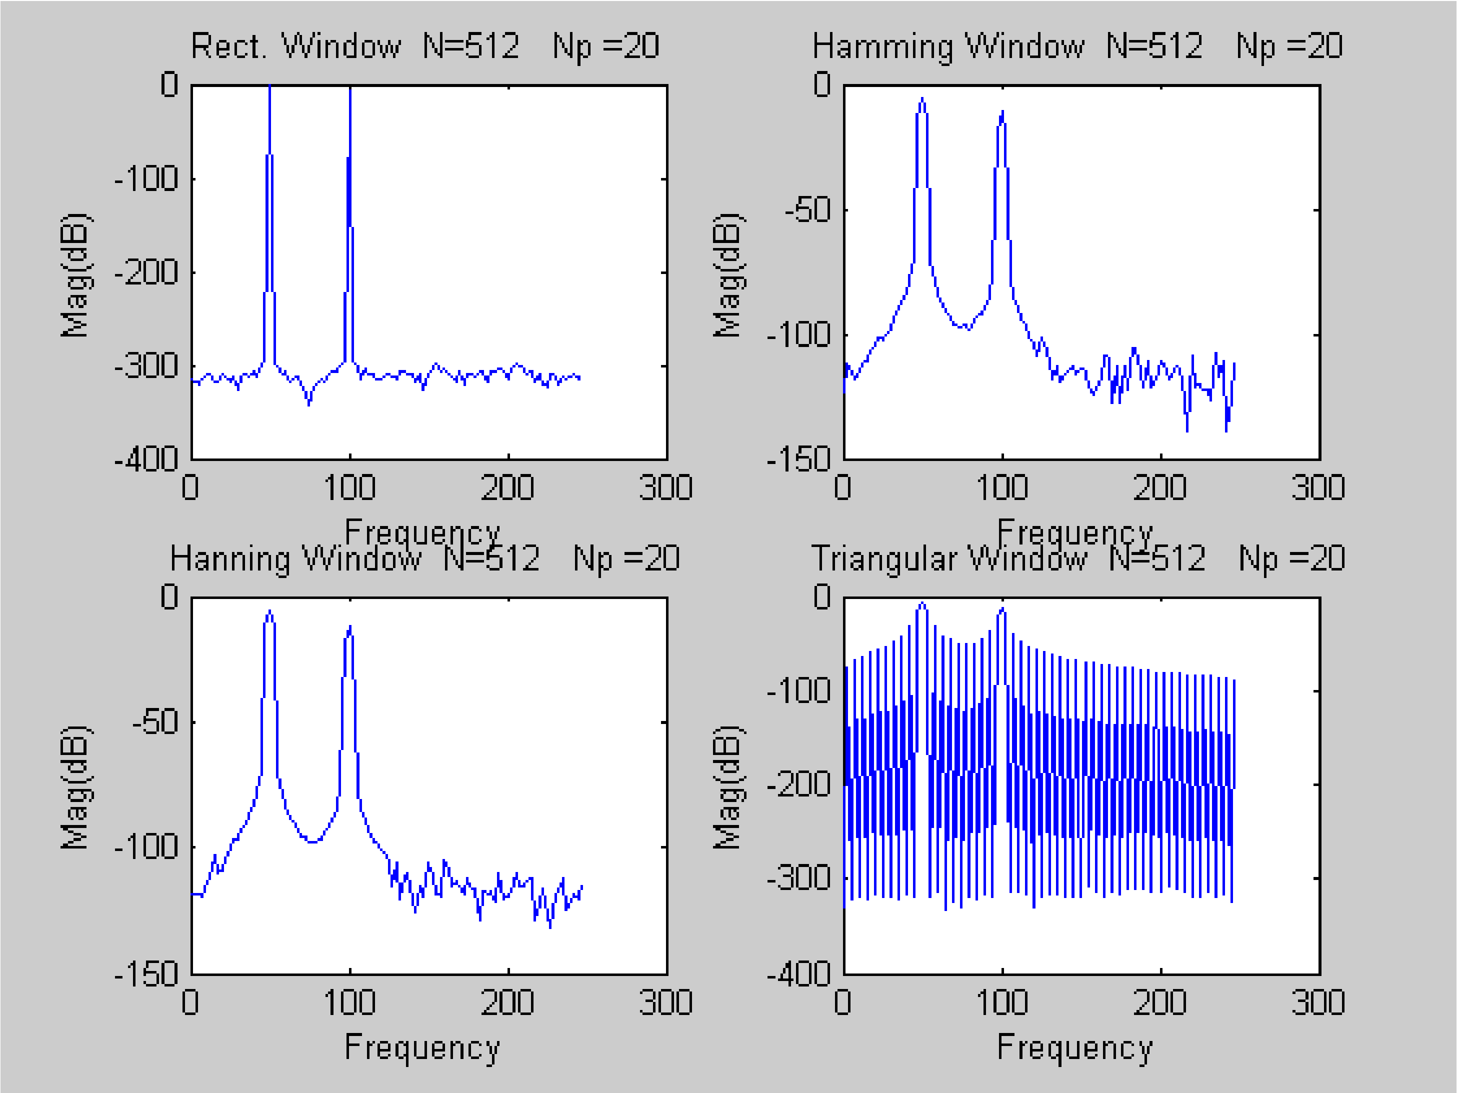
Consider situation where we really do have coherent sampling and a window is applied

fsig1=50Hz
fsig2=100Hz
N=512
Np=20

Comparison of 4 windows when sampling hypothesis are satisfied



Comparison of 4 windows



But windows can make things worse too!

Consider situation where we really do have coherent sampling and a window is applied

fsig1=50Hz
fsig2=100Hz
N=512
Np=20

And we do not really know how much worse thing can be!

Be careful about interpreting results obtained by using windowing to mitigate the non-coherent sampling problem !

Remember the hypothesis of the theorem relating the DFT, which is easy to calculate, to the Fourier Series coefficients!

Preliminary Observations about Windows

- Provide separation of spectral components
- Energy can be accumulated around spectral components
- Simple to apply
- Some windows work much better than others

But – windows do not provide dramatic improvement and can significantly degrade performance if sampling hypothesis are met

Issues of Concern for Spectral Analysis

An integral number of periods is critical for spectral analysis

Not easy to satisfy this requirement in the laboratory

Windowing can help but can hurt as well

Out of band energy can be reflected back into bands of interest

Characterization of CAD tool environment is essential

Spectral Characterization of high-resolution data converters requires particularly critical consideration to avoid simulations or measurements from masking real performance

Stay Safe and Stay Healthy !
