Review from last lecture:

Where we are at:

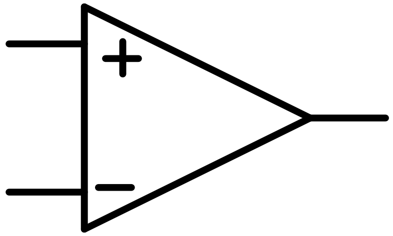
Basic Op Amp Design

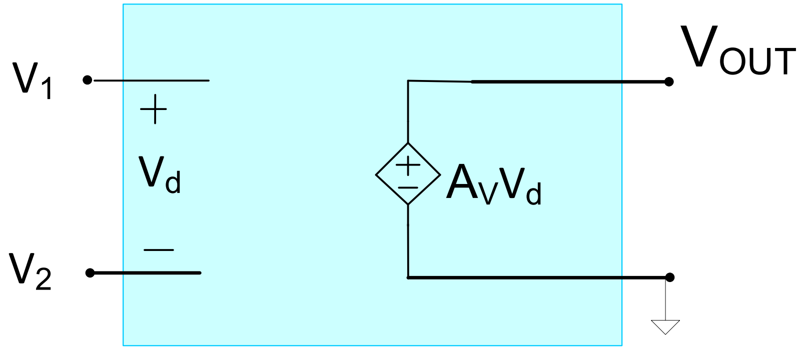
- Fundamental Amplifier Design Issues
- Single-Stage Low Gain Op Amps
- Single-Stage High Gain Op Amps
- Two-Stage Op Amp
- Other Basic Gain Enhancement Approaches

Review from last lecture:

How is Common-Mode Gain Modeled?

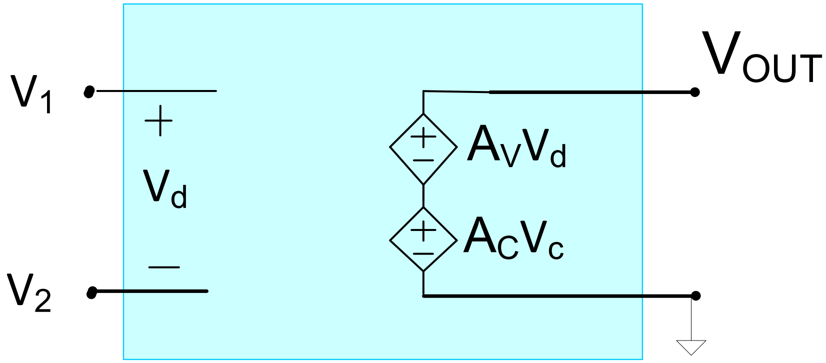
If Op Amp is a Voltage Amplifier with infinite input impedance, zero output impedance, and one terminal of the output is grounded





Ideal Differential Voltage Amplifier

$$V_d = V_1 - V_2$$



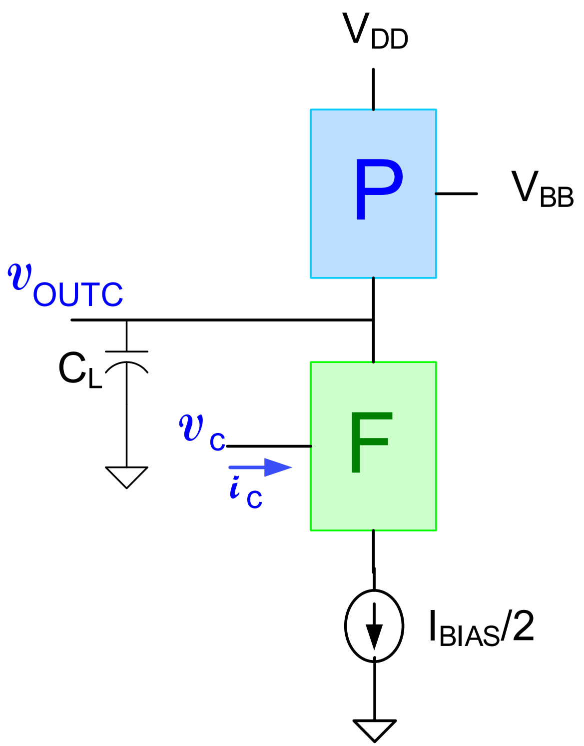
Ideal Voltage Amplifier

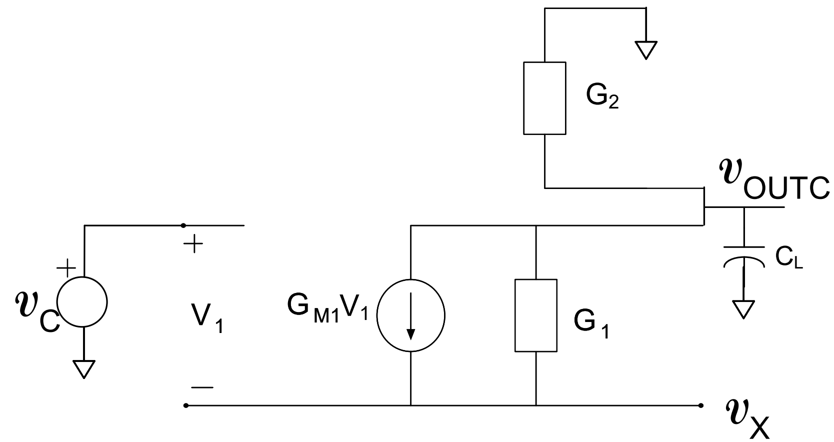
$$V_d = V_1 - V_2 \qquad V_c = \frac{V_1 + V_2}{2}$$

Review from last lecture:

Performance with Common-Mode Input

Consider tail-current bias amplifier with i_c=0





$$\left.\begin{array}{l} v_{OUTC}(sC+G_1+G_2)+G_{M1}v_1 = G_1 v_X \\ v_C = v_1+v_X \\ v_X G_1 - G_{M1}v_1 = v_{OUTC}\, G_1 \end{array}\right\}$$

Solving, we obtain

$v_{OUTC}=0$ thus $A_C=0$

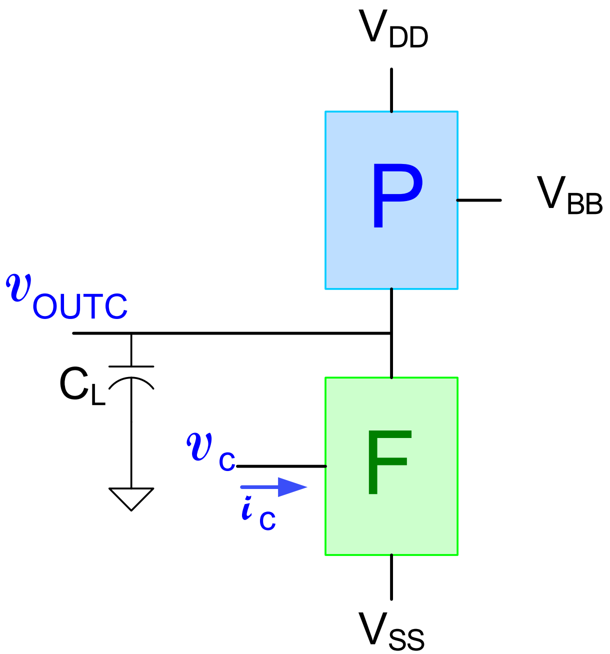
Common-Mode Half-Circuit

(Note: Have assumed an ideal tail current source in this analysis
A_C will be small but may not vanish if tail current source is not ideal)

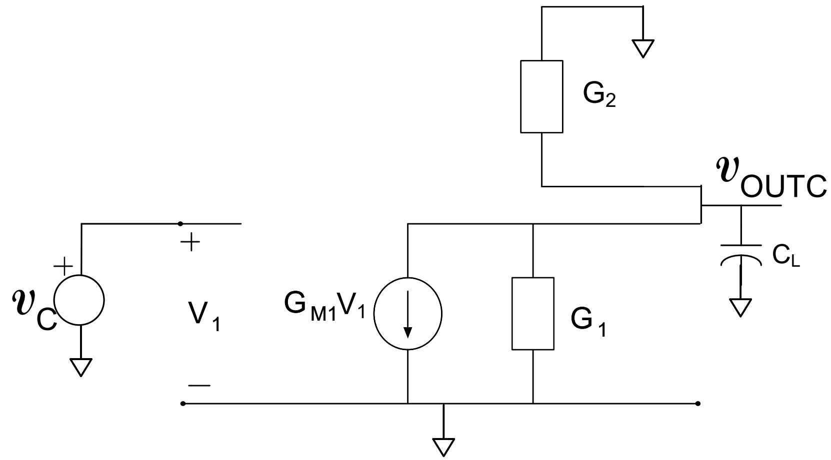
Review from last lecture:

Performance with Common-Mode Input

Consider tail-voltage bias amplifier with i_c=0



Common-Mode Half-Circuit



$$\left.\begin{array}{l} v_{OUTC}\left(sC+G_1+G_2\right)+G_{M1}v_1=0 \\ v_C=v_1 \end{array}\right\}$$

Solving, we obtain

$$\frac{v_{OUTC}}{v_C}=A_C=\frac{-G_{M1}}{sC+G_1+G_2}$$

This circuit has a rather large common-mode gain and will not reject common-mode signals

- Not a very good differential amplifier
- But of no concern in applications where v_C=0

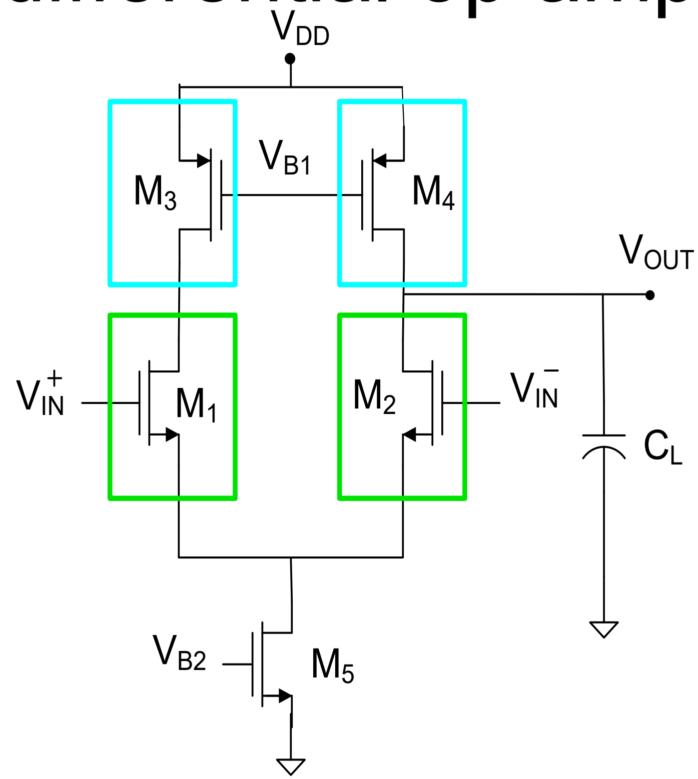
Review from last lecture:

Design of Basic Single-stage low-gain differential op amp

$$A(s)=\frac{-\frac{g_{m1}}{2}}{sC_L+g_{o1}+g_{o3}}$$

$$A_o=\frac{\frac{g_{m1}}{2}}{g_{o1}+g_{o3}}$$

$$GB=\frac{g_{m1}}{2C_L}$$



What are the number of degrees of freedom?
(assume V_{DD}, C_L fixed, Symmetry)

Need a CMFB circuit to establish V_{B1}

Natural Parameters:

$$\left\{\frac{W_1}{L_1},\frac{W_3}{L_3},\frac{W_5}{L_5},V_{B1},V_{B2}\right\}$$

Constraints: $I_{D5} \simeq 2I_{D3}$

Net Degrees of Freedom: 4

Practical Parameters:

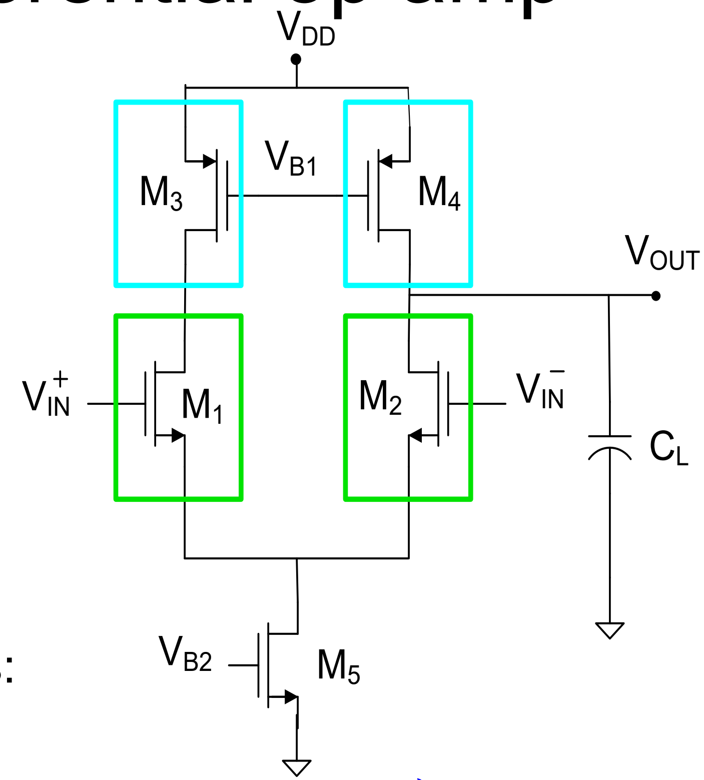
$$\{V_{EB1},V_{EB3},V_{EB5},P\}$$

Will now express performance characteristics in terms of Practical Parameters

Design of Basic Single-stage low-gain differential op amp

Single-Ended Output : Differential Input Gain

Practical Parameters: $\{V_{EB1}, V_{EB3}, V_{EB5}, P\}$



$$A_0 = \left[\frac{1}{\lambda_1 + \lambda_3}\right]\left(\frac{1}{V_{EB1}}\right) \qquad GB = \left(\frac{P}{V_{DD}C_L}\right) \bullet \left[\frac{1}{2V_{EB1}}\right]$$

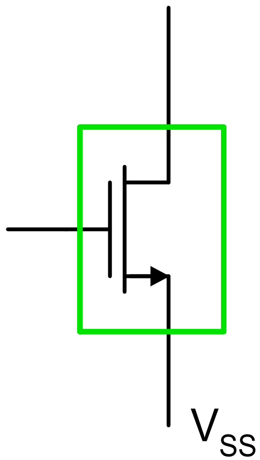
Design Strategy with fixed A_0 and GB requirements:

1. Pick V_{EB1} to meet gain requirements — $\{\cancel{V_{EB1}}, V_{EB3}, V_{EB5}, P\}$
2. Pick P to meet GB requirements — $\{\cancel{V_{EB1}}, V_{EB3}, V_{EB5}, \cancel{P}\}$
3. Pick V_{EB3} and V_{EB5} to achieve other desirable properties (i.e. explore the remaining part of the design space)

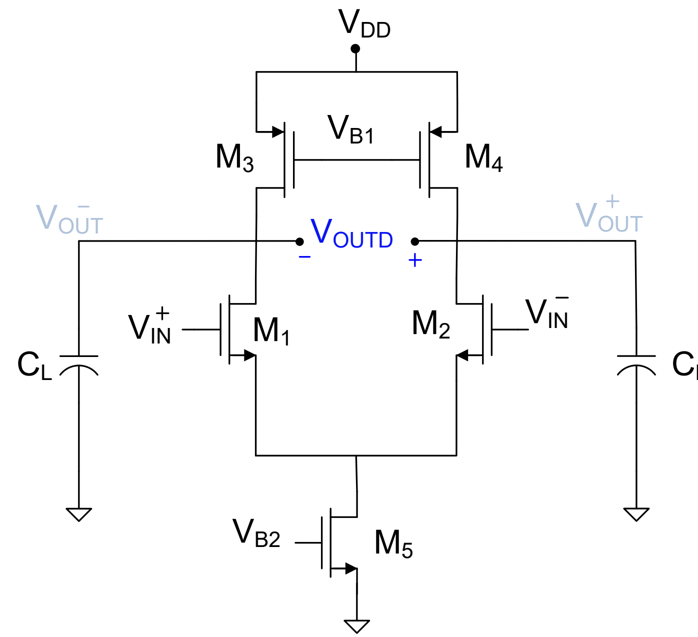
Note: Design strategy may change if A_0 and GB are not firm requirements

Single-stage low-gain differential I/O op amp

Quarter Circuit



$$\mathbf{V_{OD} = V_O^+ - V_O^-}$$



Differential Output : Differential Input Gain

$$A(s) = \frac{g_{m1}}{sC_L + g_{O1} + g_{O3}}$$

$$A_O = \frac{g_{m1}}{g_{O1} + g_{O3}}$$

$$GB = \frac{g_{m1}}{C_L}$$

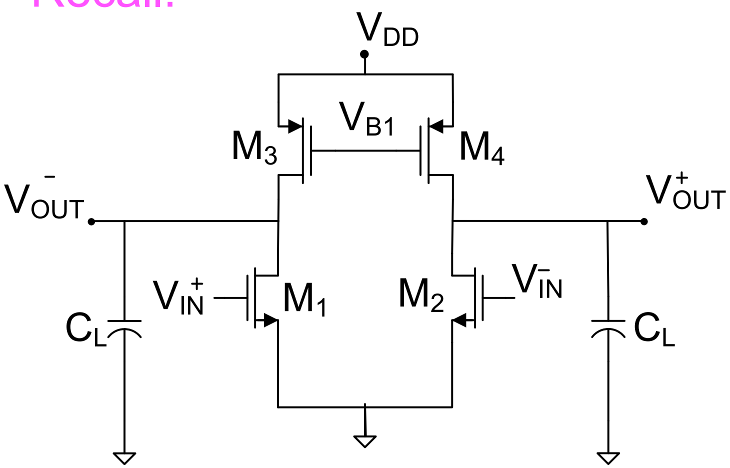
$$A_0 = \left[\frac{1}{\lambda_1 + \lambda_3}\right]\left(\frac{2}{V_{EB1}}\right) \qquad GB = \left(\frac{P}{V_{DD} C_L}\right) \bullet \left[\frac{1}{V_{EB1}}\right]$$

Have 4 degrees of freedom but only two practical variables impact A_0 and GB so still have 2 DOF after meet A_0 and GB requirements that can be used for other purposes

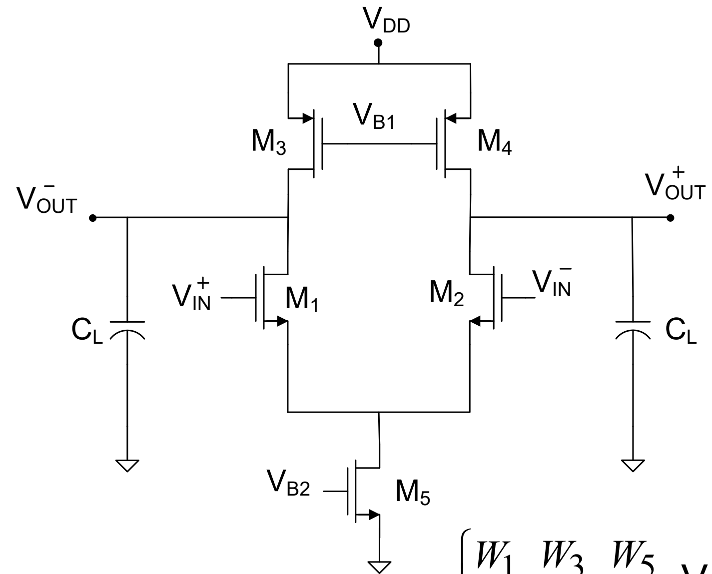
Need a CMFB circuit to establish V_{B1} or V_{B2}

A_D expressions valid for both tail-current and tail-voltage op amp

Recall:



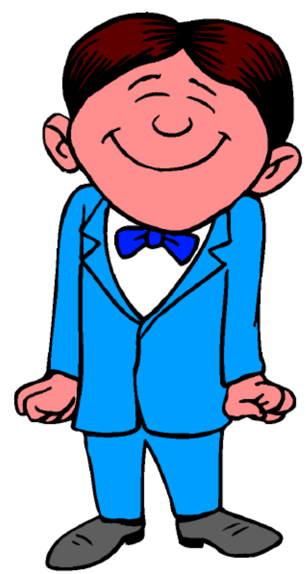
$$\left\{\frac{W_1}{L_1}, \frac{W_3}{L_3}, V_{B1}\right\}$$



$$\left\{\frac{W_1}{L_1}, \frac{W_3}{L_3}, \frac{W_5}{L_5}, V_{B1}, V_{B3}\right\}$$

So which one should be used?

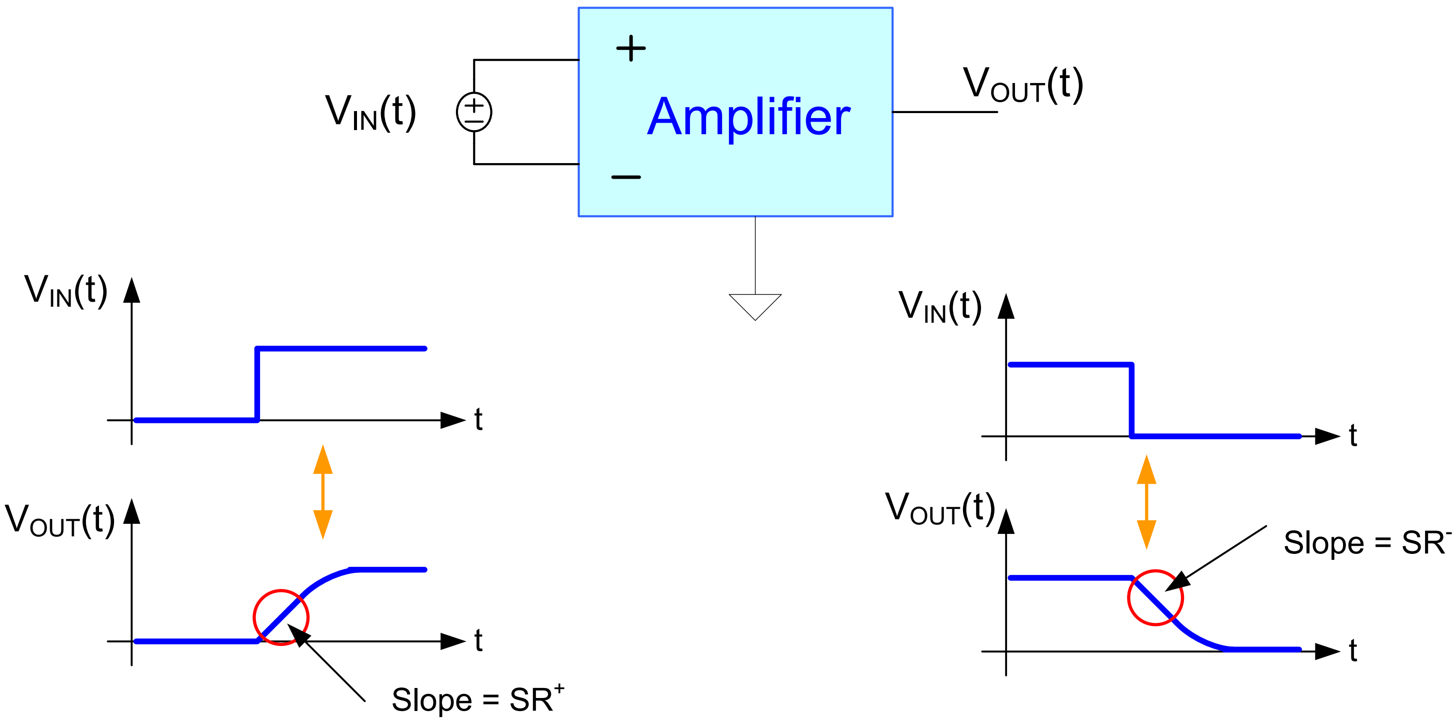
- Common-mode input range large for tail current bias
- Improved rejection of common-mode signals for tail current bias
- Two extra design degree of freedom for tail current bias
- Improved output signal swing for tail voltage bias (will show later)



- Fully Differential Single-Stage Amplifier
  - General Differential Analysis
  - 5T Op Amp from simple quarter circuit
  - Biasing with CMFB circuit
  - Common-mode and differential-mode analysis
  - Common Mode Gain
  - Overall Transfer Characteristics
- Design of 5T Op Amp
- Slew Rate

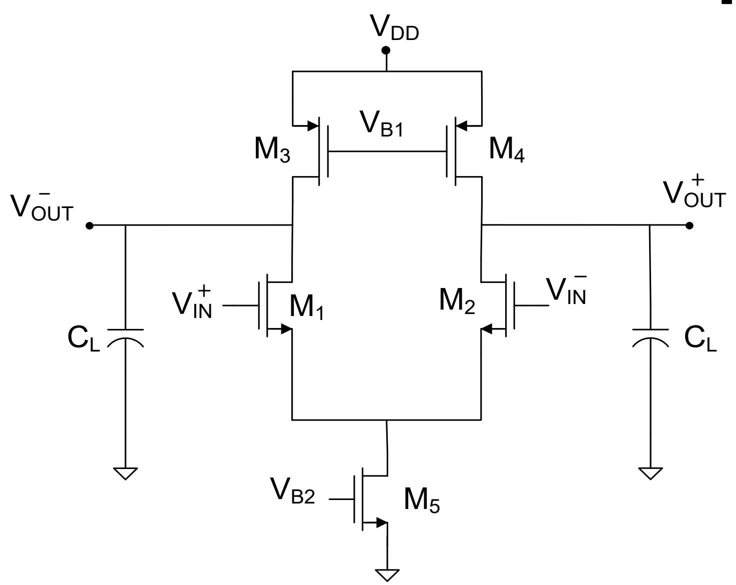
Slew Rate

Definition: The slew rate of an amplifier is the maximum rate of change that can occur at the output node



- SR is a nonlinear large-signal characteristic
- Input is over-driven (some devices in amplifier usually leave normal operating region)
- Hard input overdrive depicted in this figure
- Magnitude of SR^+ and SR^- usually same and called SR (else SR^+ and SR^- must be given)

Slew Rate for 5T Op Amp



With large step input on V_{IN}^{+}, all tail current (I_T) will go to M_1 thus turning off M_2 thus current through M_4 which is ½ of I_T will go to load capacitor C_L

The I-V characteristics of any capacitor is

$$I = C\frac{dV}{dt}$$

Substituting $I=I_T/2$, $V=V_{OUT}^{+}$ and $C=C_L$ obtain a voltage ramp at the output thus

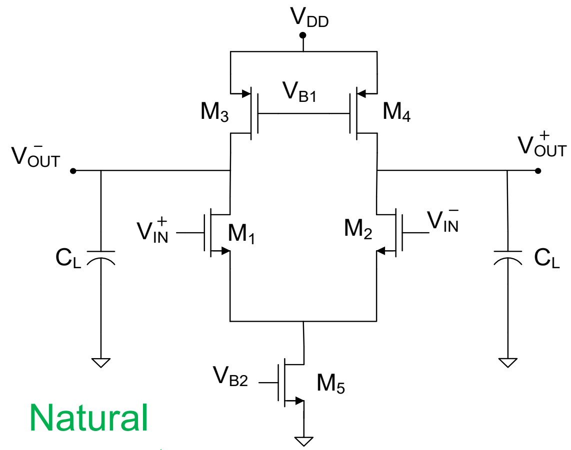
$$SR^{+} = \frac{dV_{OUT}^{+}}{dt} = \frac{I_T}{2C_L}$$

Natural parameter domain

$$SR^{+} = \frac{P}{V_{DD}2C_L}$$

Practical parameter domain

Slew Rate for 5T Op Amp



$$SR^+ = \frac{I_T}{2C_L}$$

Natural parameter domain

$$SR^+ = \frac{P}{V_{DD} 2C_L}$$

Practical parameter domain

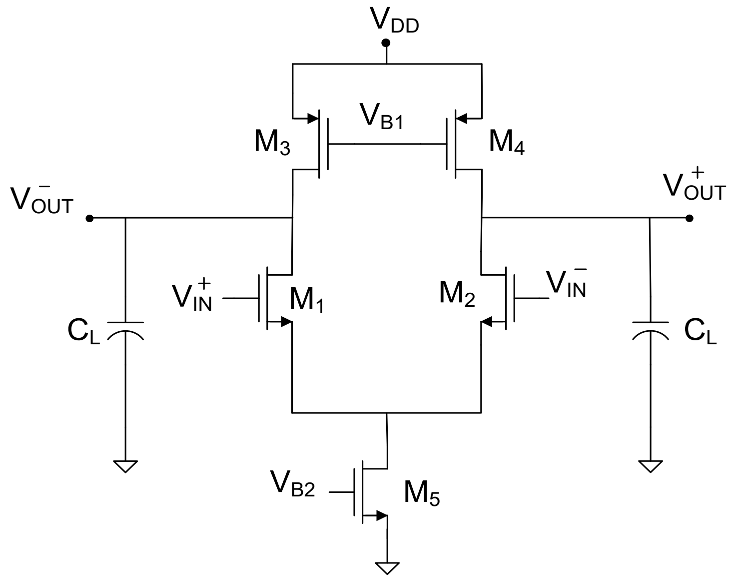
Question: Can SR⁺ be expressed as product of model parameters and architecture dependent term?

$$SR^+ = \left[\frac{1}{2C_L}\right][I_T] \qquad SR^+ = \left[\frac{1}{V_{DD} 2C_L}\right][P]$$

Question: Can SR⁺ be expressed in small-signal parameter domain?

$$SR^+ = \frac{g_{o1}}{\lambda C_L} = \left[\frac{1}{\lambda C_L}\right][g_{o1}]$$

Slew Rate



It can be similarly shown that putting a large negative step on the input steer all current to M_2 thus the current to the capacitor C_L will be I_T minus the current from M_2 which is still $I_T/2$. This will cause a negative ramp voltage on V_{OUT}^+ of value

$$SR^- = \frac{dV_{OUT}^+}{dt} = -\frac{I_T}{2C_L} = -\frac{P}{V_{DD} 2C_L}$$

Since the magnitude of SR^+ and SR^- are the same, obtain a single SR for the amplifier of value

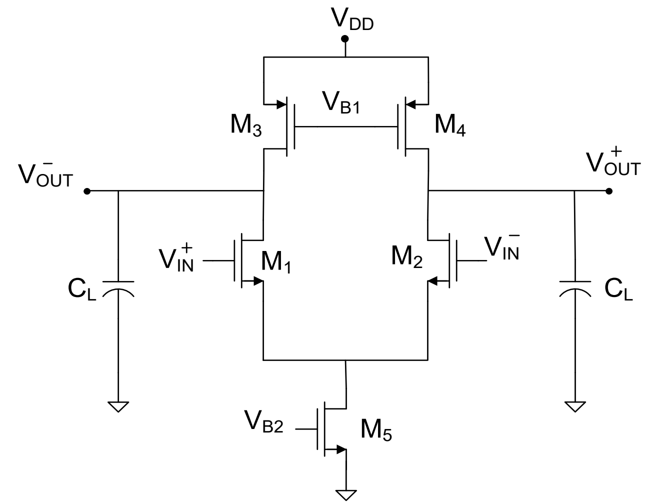
$$SR = \frac{P}{V_{DD} 2C_L}$$

Interdependence of Parameters

$$A_0 = \left[\frac{1}{\lambda_1 + \lambda_3}\right]\left(\frac{1}{V_{EB1}}\right)$$

$$GB = \left(\frac{1}{2V_{DD}C_L}\right) \bullet \left[\frac{P}{V_{EB1}}\right]$$

$$SR = \frac{P}{V_{DD}2C_L}$$



Note: With this structure, the three key performance characteristics $\{A_0, GB, SR\}$ can not be independently specified

e.g. If V_{EB1} is picked to set A_0, then $\frac{P}{V_{DD}C_L}$ will determine both GB and SR

Alternately, observe $SR = \frac{GB}{A_0(\lambda_1 + \lambda_2)}$

The Reference Op Amp

Would like to have a specific amplifier, termed a Reference Op Amp, that can serve as a base-line so can compare performance of other op amp architectures with respect to that of the Reference Op Amp

Will use the 5T Op Amp as a Reference Op Amp for comparing single-stage Op Amps

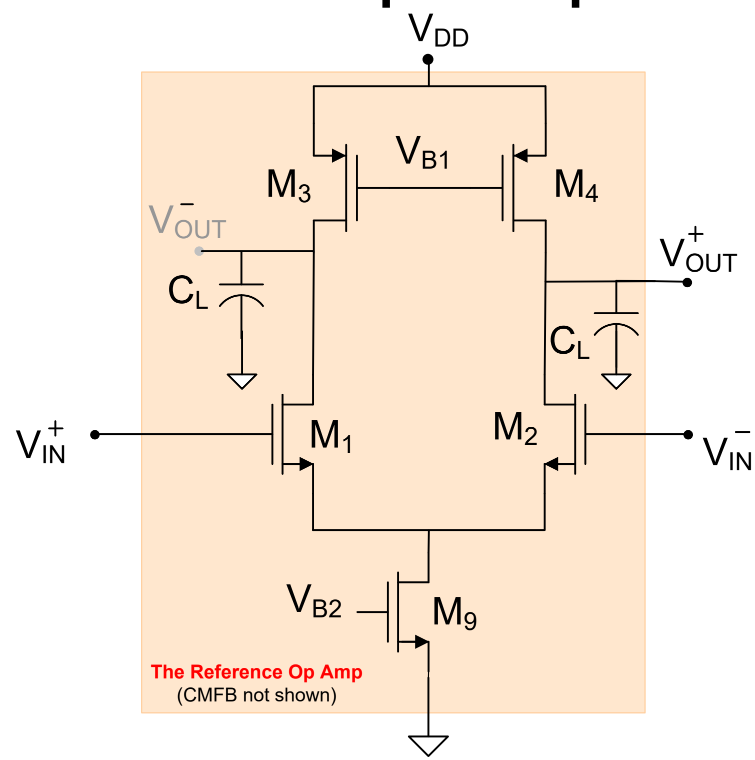
Single-stage low-gain differential op amp

Consider single-ended output performance :

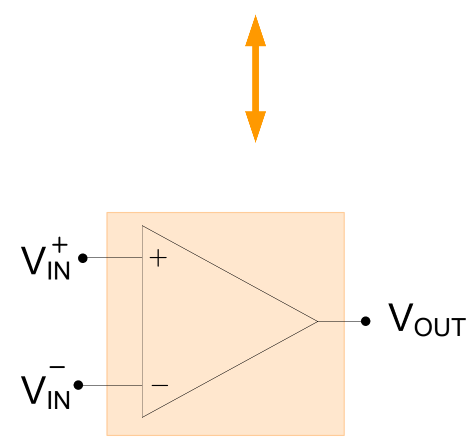
Will term this the **reference op amp**

Will make performance comparisons of other op amps relative to this

$$A(s)=\frac{\frac{g_{m1}}{2}}{sC_L+g_{O1}+g_{O3}}$$

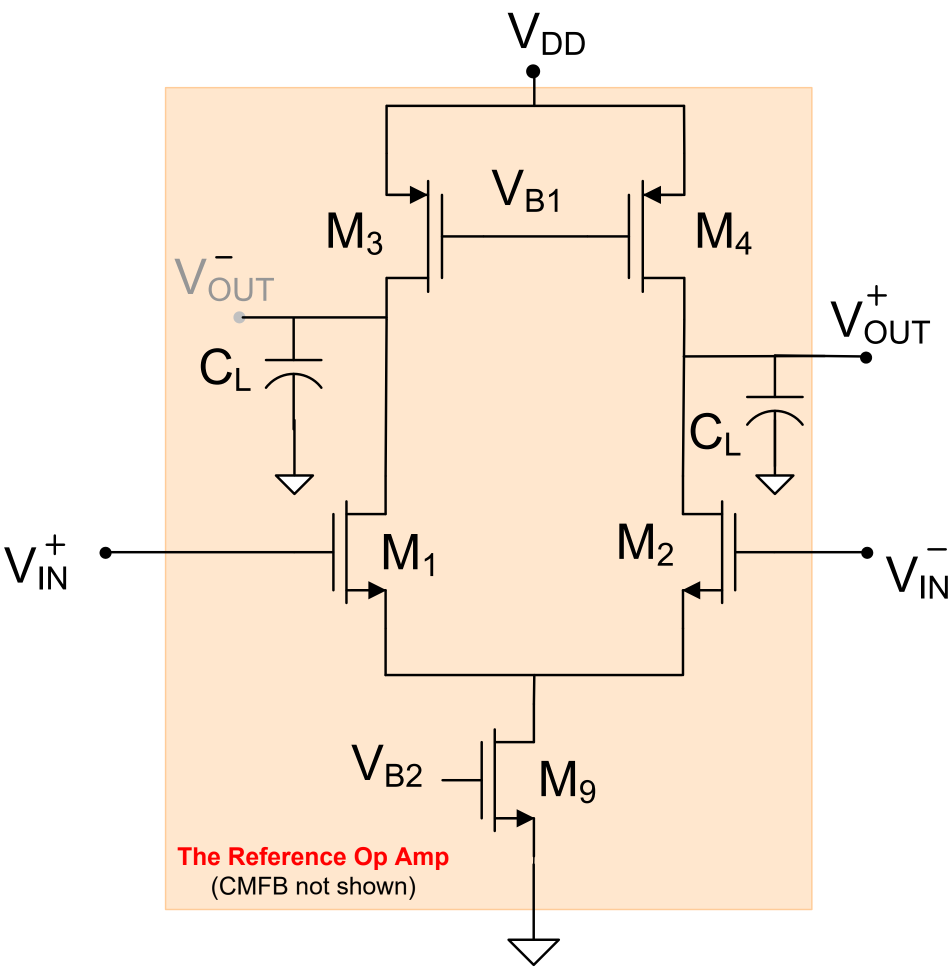


mixed parameters	practical parameters
$A_{VO}=\frac{1}{2}\frac{g_{m1}}{g_{O1}+g_{O3}}$	$A_{V0}=\left[\frac{1}{\lambda_1+\lambda_3}\right]\left(\frac{1}{V_{EB1}}\right)$
$GB=\frac{g_{m1}}{2C_L}$	$GB=\left(\frac{P}{2V_{DD}C_L}\right)\bullet\left[\frac{1}{V_{EB1}}\right]$
$SR=\frac{I_T}{2C_L}$	$SR=\frac{P}{2V_{DD}C_L}$



Reference Op Amp

single-ended output



$$A(s) = \frac{\frac{g_{m1}}{2}}{sC_L + g_{O1} + g_{O3}}$$

mixed parameters	practical parameters
$A_{VO} = \frac{1}{2}\frac{g_{m1}}{g_{O1}+g_{O3}}$	$A_{V0} = \left[\frac{1}{\lambda_1 + \lambda_3}\right]\left(\frac{1}{V_{EB1}}\right)$
$GB = \frac{g_{m1}}{2C_L}$	$GB = \left(\frac{P}{2V_{DD}C_L}\right) \bullet \left[\frac{1}{V_{EB1}}\right]$
$SR = \frac{I_T}{2C_L}$	$SR = \frac{P}{2V_{DD}C_L}$

- This is probably the simplest differential input op amp and is widely used
- Will go to more complicated structures only if better performance is required

Amplifier Structure Summary

Small Signal Parameter Domain		
Common Source	$A_{VO} = \frac{g_m}{g_O}$	$GB = \frac{g_m}{C_L}$

Practical Parameter Domain		
Common Source	$A_{VO} = \left(\frac{2}{\lambda}\right)\left(\frac{1}{V_{EB}}\right)$	$GB = \left(\frac{2P}{V_{DD}C_L}\right)\left(\frac{1}{V_{EB}}\right)$

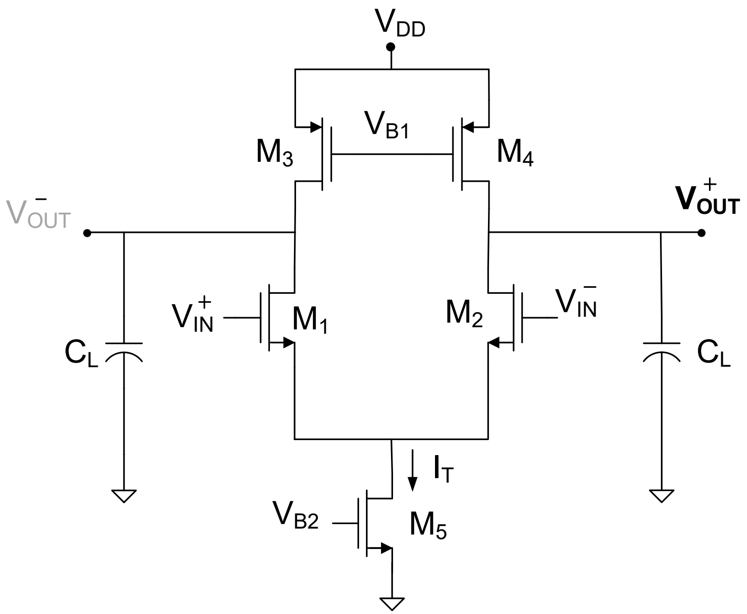
Small Signal Parameter Domain			
Reference Op Amp (single-ended ouput)	$A_{VO} = \frac{1}{2}\frac{g_{m1}}{g_{O1}+g_{O3}}$	$GB = \frac{g_{m1}}{2C_L}$	$SR = \frac{g_{01}}{\lambda C_L}$

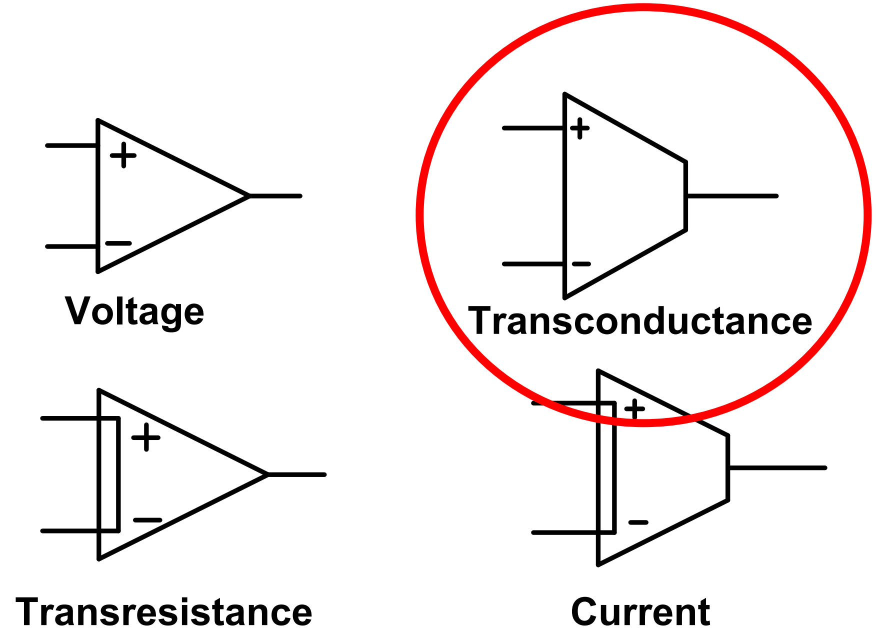
Practical Parameter Domain			
Reference Op Amp(single-ended ouput)	$A_{V0} = \left[\frac{1}{\lambda_1+\lambda_3}\right]\left(\frac{1}{V_{EB1}}\right)$	$GB = \left(\frac{P}{2V_{DD}C_L}\right)\bullet\left[\frac{1}{V_{EB1}}\right]$	$SR = \frac{P}{2V_{DD}C_L}$

Reference Op Amp

single-ended output

What basic type of amplifier is this op amp?





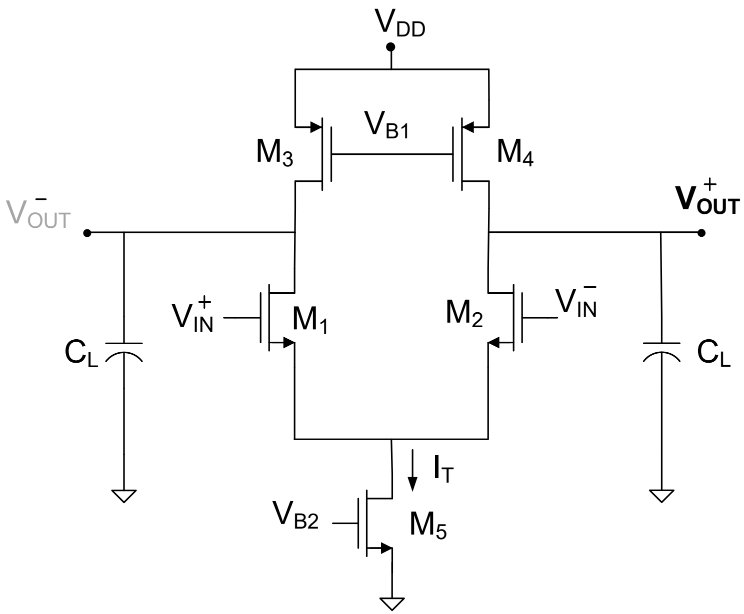
$$A(s) = \frac{\frac{g_{m1}}{2}}{sC_L + g_{O1} + g_{O3}}$$

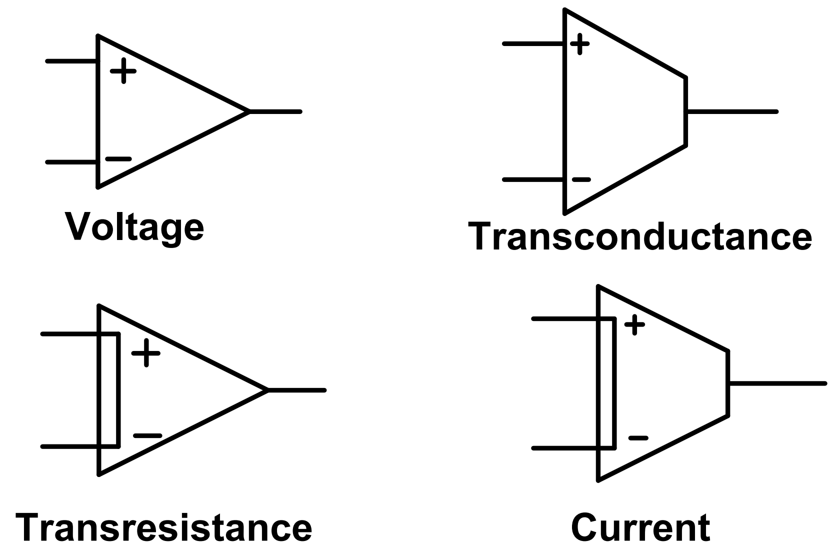
Reference Op Amp

single-ended output

What basic type of amplifier is this op amp? Transconductance

Does it really matter?





$$A(s) = \frac{\frac{g_{m1}}{2}}{sC_L + g_{O1} + g_{O3}}$$

Where we are at:

Basic Op Amp Design

- Fundamental Amplifier Design Issues
- Single-Stage Low Gain Op Amps
- Single-Stage High Gain Op Amps
- Two-Stage Op Amp
- Other Basic Gain Enhancement Approaches

Where we are at:

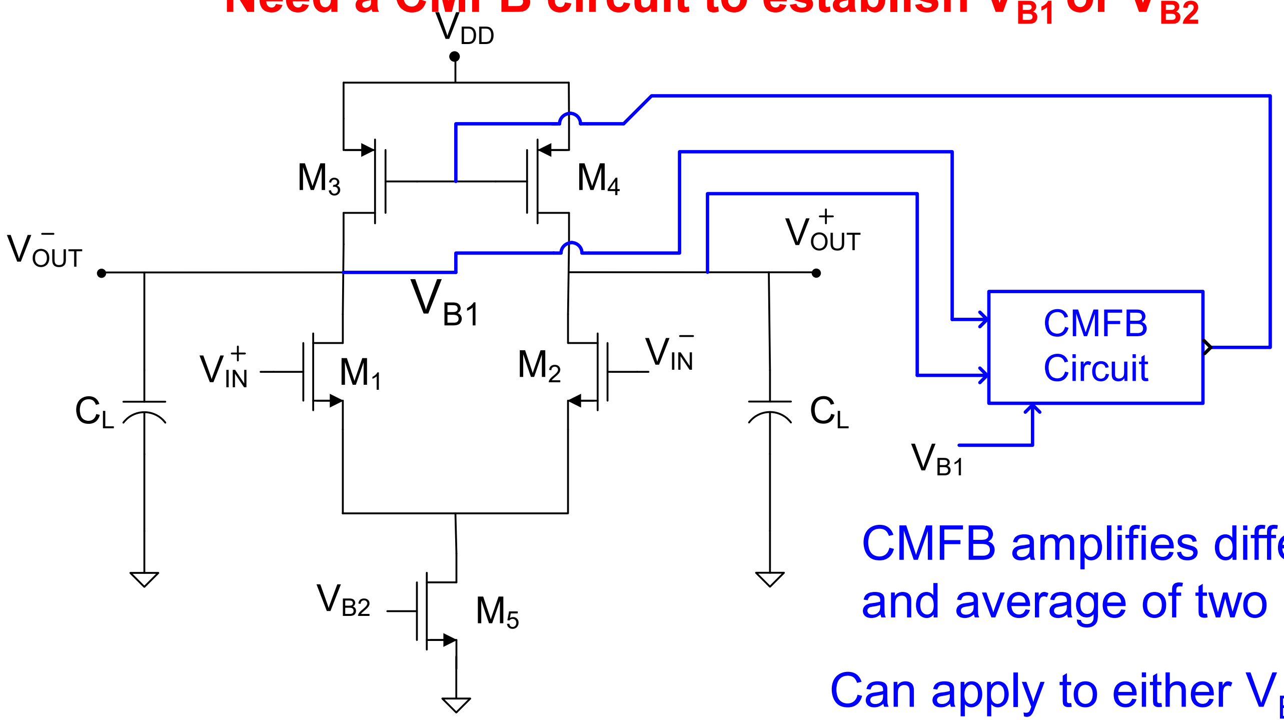
Basic Op Amp Design

Single-Stage Low Gain Op Amps

- 5T Op Amp
- 5T Current-Mirror Bias Op Amp

The 5T Op Amp

Need a CMFB circuit to establish V_{B1} or V_{B2}



CMFB amplifies difference between V_{B1} and average of two signal inputs

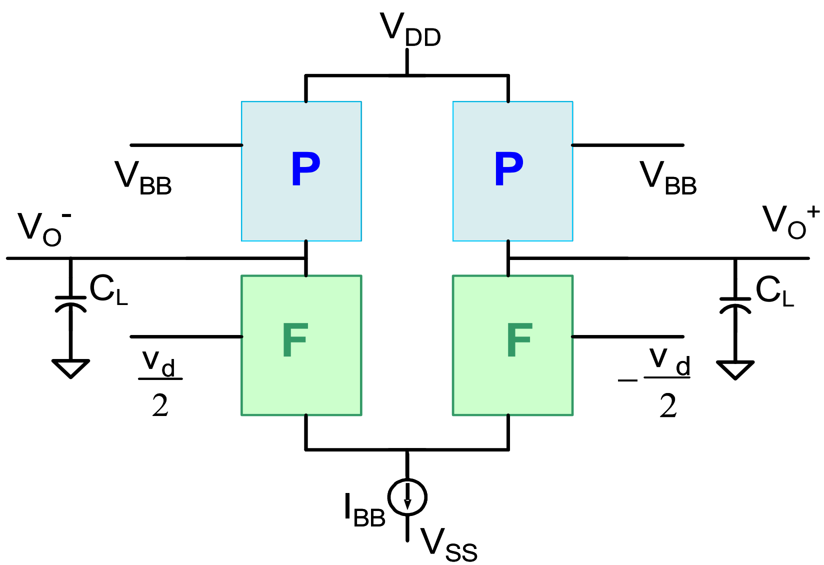
Can apply to either V_{B1} or V_{B2} but not both

Often apply to only fraction of transistor

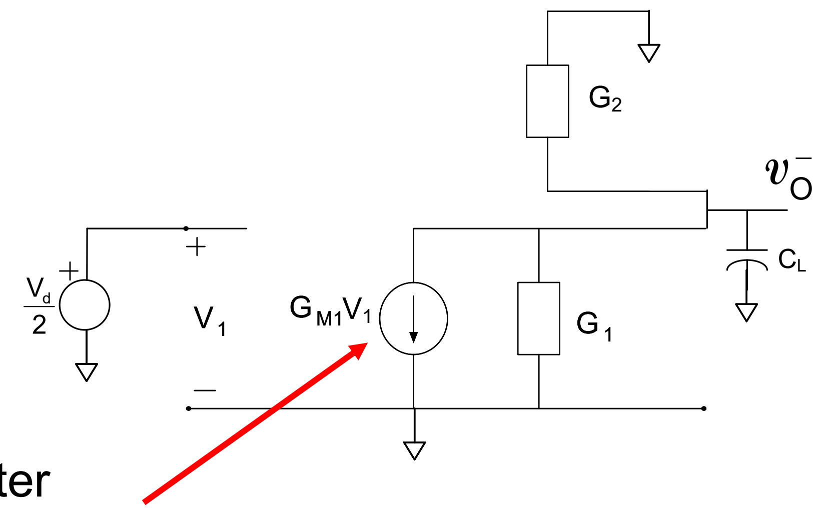
The CMFB circuit is often quite large and requires considerable design effort!

Can the CMFB be removed?

Operation of Op Amp – A conceptual observation



Small signal differential half-circuit



- The signal dependent current in quarter circuit is steered to output node and drives the parallel output conductances of the quarter circuit and counterpart circuit

$$A_{VO} = \frac{-G_{M1}}{2(G_1 + G_2)}$$

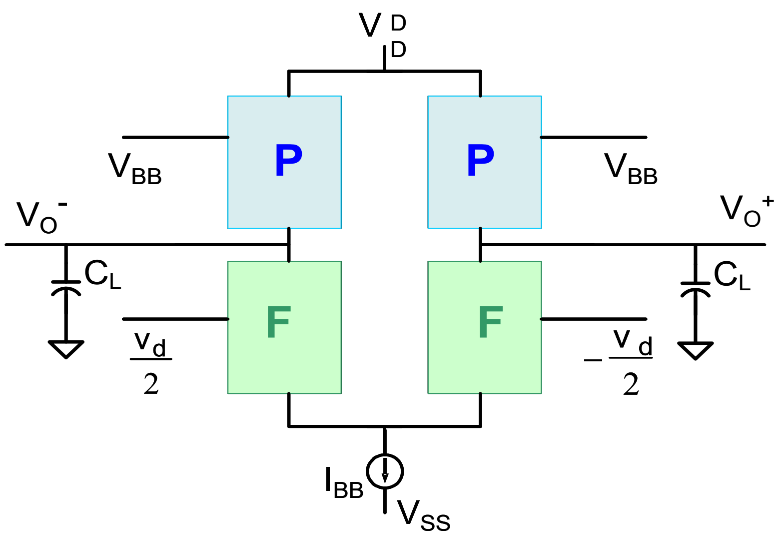
- If G_1 and G_2 are small, the voltage gain will be large

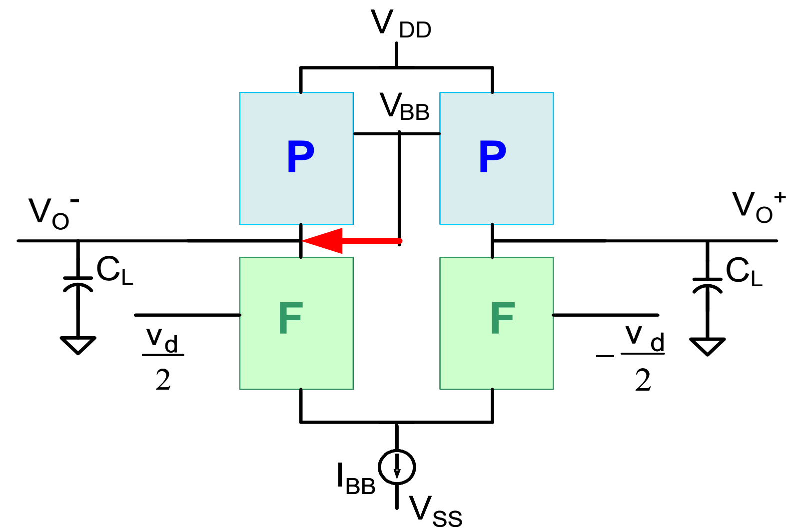
$$BW = \frac{G_1 + G_2}{C_L}$$

- If the signal-dependent current could be doubled without changing the output conductances, the gain would be doubled as well !

$$GB = \frac{G_{M1}}{2C_L}$$

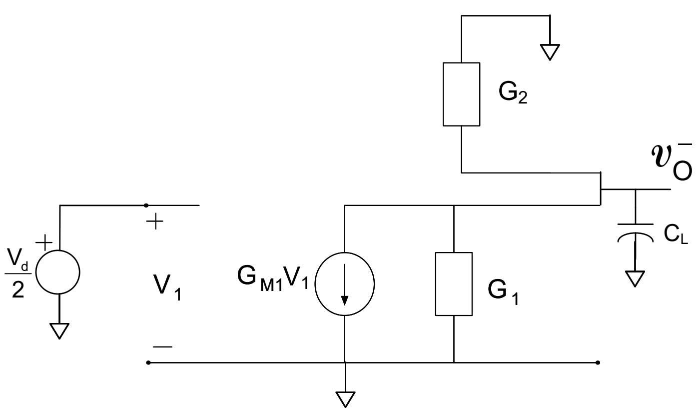
Operation of Op Amp – A conceptual observation





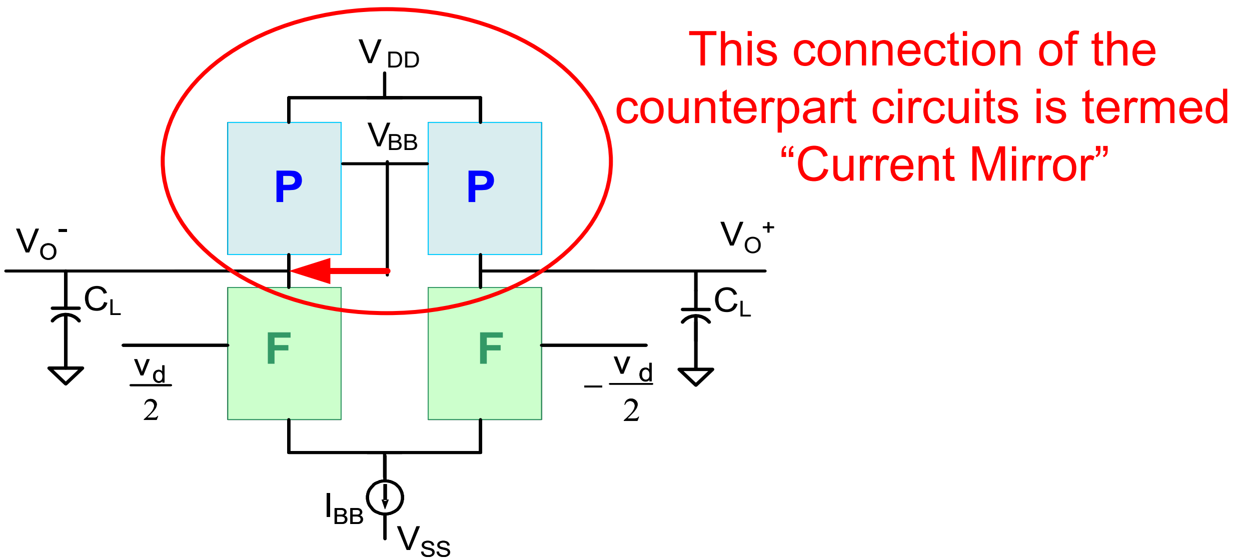
- If the input impedance to the counterpart circuit is infinite and the quiescent values of the left and right drain voltages are the same, connecting the bias port of the counterpart circuit to V_0^- instead of to V_{BB} will cause the signal current in the right counterpart circuit to be equal to that in the left counterpart circuit
- Voltage Gain to V_{OUT}^- not high so this output seldom used
- This will approximately double the signal current steered to V_o^+ and thus doubles the voltage gain ! (formal derivation on following slide)
- This will also eliminate the need for a CMFB circuit !!

Small signal differential half-circuit



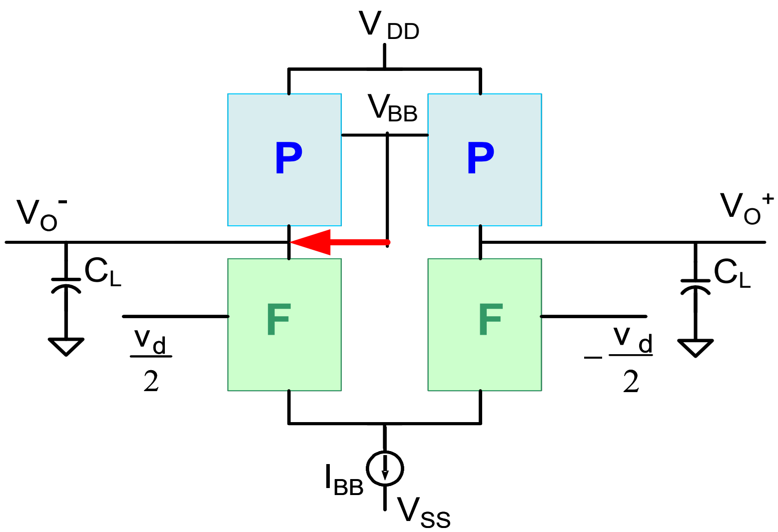
No signal current driving counterpart circuit

Terminology: "Current Mirror" connection



- Will now analyze this circuit to show the gain is doubled !
- Will follow this by a more detailed discussion of the Current Mirror

Doubling of Gain with "Current Mirror" connection

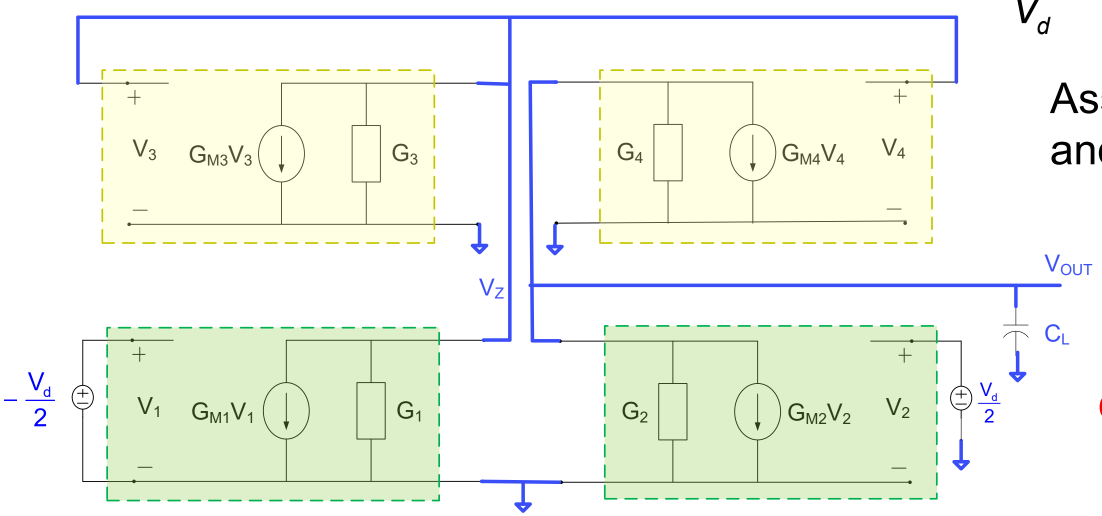


From KCL at two drain nodes ($V_{OUT}=V_O^+$, $V_Z=V_O^-$)

$$\left.\begin{aligned} V_{OUT}\left(sC_L+G_2+G_4\right)+G_{M2}\frac{V_d}{2}+G_{M4}V_Z&=0\\ V_Z\left(G_1+G_3\right)+G_{M3}V_Z-G_{M1}\frac{V_d}{2}&=0 \end{aligned}\right\}$$

Eliminating V_Z we obtain

$$\frac{V_{OUT}}{V_d}=A_{VD}=-\frac{G_{M4}G_{M1}+G_{M2}G_{M3}+G_{M2}\left(G_1+G_3\right)}{2\left(sC_L+G_2+G_4\right)\left(G_1+G_3+G_{M3}\right)}$$

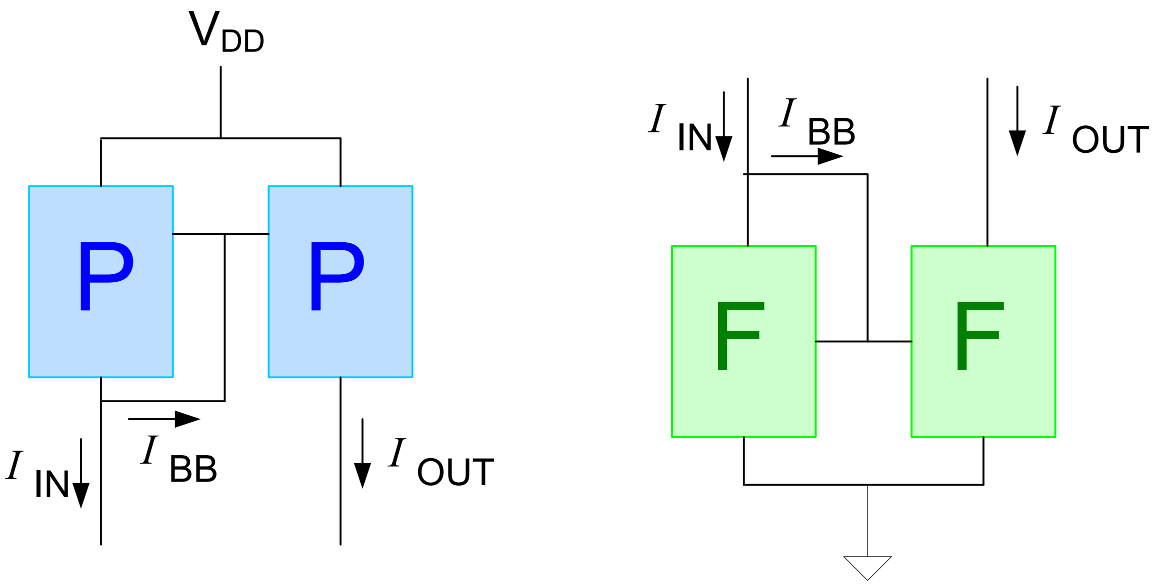


Assuming G_M's large compared to G's and left-right symmetry, it follows that

$$A_{VD}=-\frac{G_{M1}}{sC_L+G_2+G_4}$$

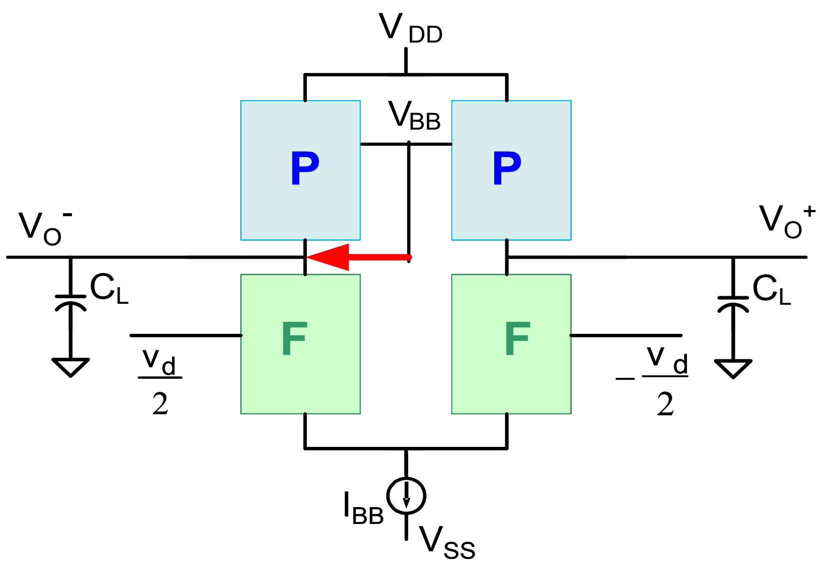
dc Voltage Gain to V_{OUT} doubled !

Current Mirrors

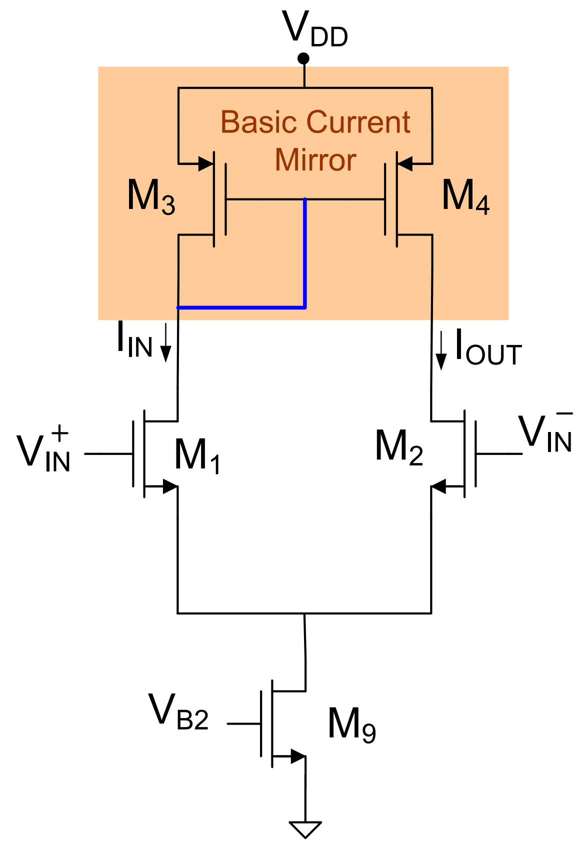


- If the current I_{BB} is small compared to I_{IN}, and the current I_{IN} is nearly independent of the voltage across P, then $I_{OUT} \approx I_{IN}$
- Circuits with this property are called Current Mirrors
- If multiple copies of the right circuit are placed in parallel, the current will be scaled by the number of copies
- These scaled circuits are also called Current Mirrors
- As long as $I_{BB} << I_{IN}$, this scaling in currents occurs even if the circuits are highly nonlinear provided the voltages across the circuits are the same!

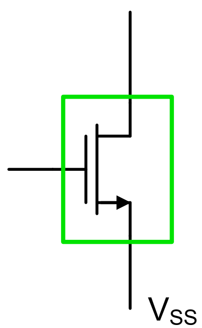
Operation of Op Amp – A different perspective



5T Current-Mirror Bias Op Amp



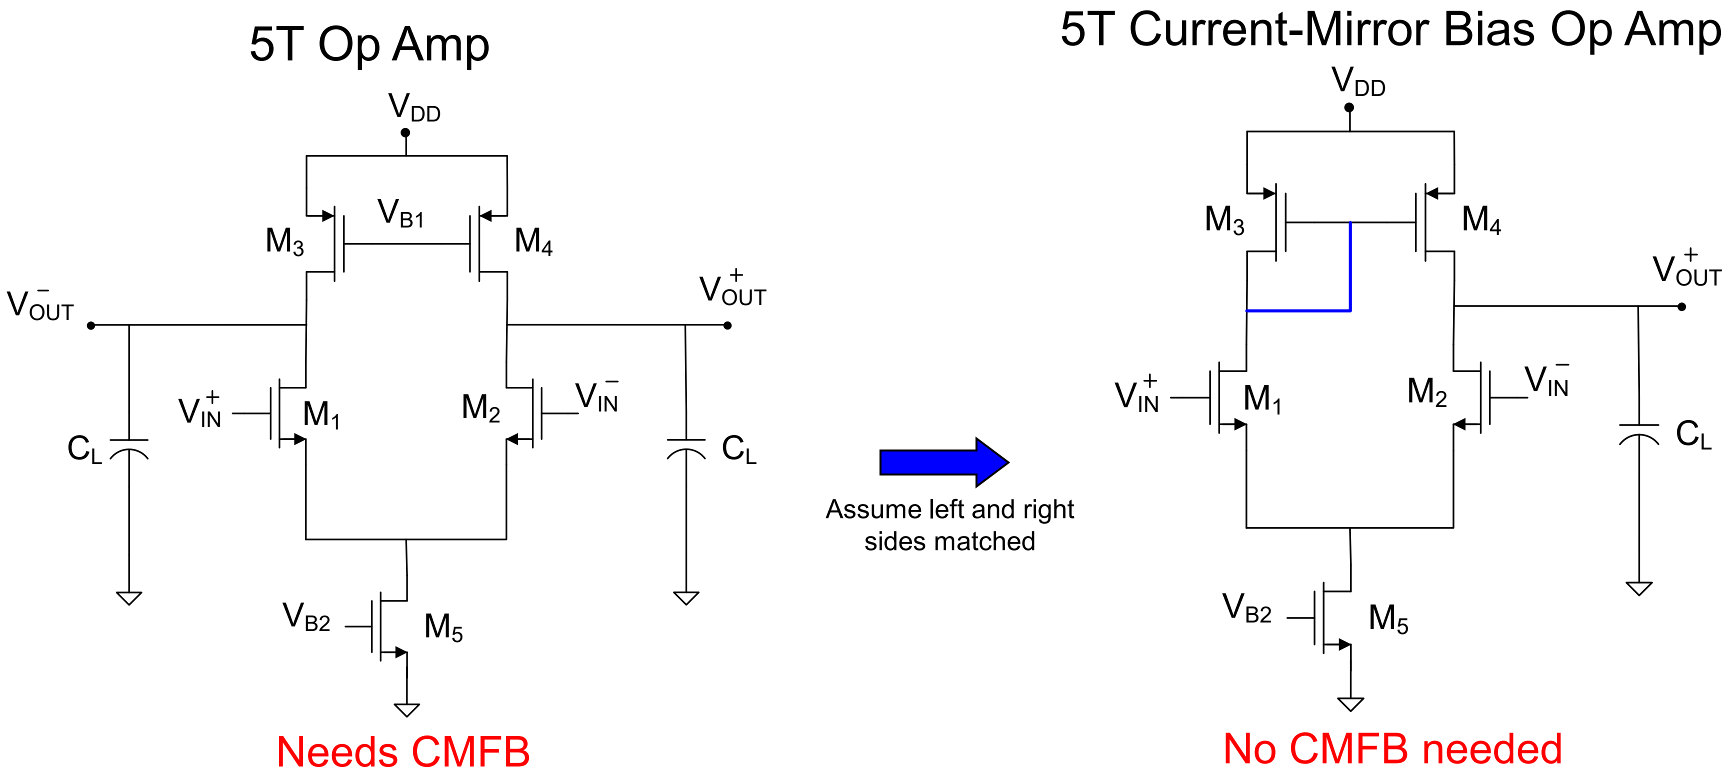
Consider using single n-mos transistor as quarter circuit



- Note counterpart circuits can be recognized as the basic current mirror
- But other current mirrors that may differ from the counterpart circuit could also be used (but then G_4 and G_2 may differ)

Single-stage low-gain differential op amp

(with M_1 as quarter circuit)



- **Can eliminate CMFB circuit <u>if only single-ended output is needed</u> by connecting counterpart circuits as a current mirror**
- **This will double the voltage gain and the GB as well**
- **Still uses counterpart circuits but terminated in different ways**
- **Although not symmetric, previous analysis results with specified modifications still nearly apply**

Slew Rate

Single-stage low-gain differential op amp

Current-Mirror Connected Counterpart Circuit

Assume left and right sides matched

When Vd large and negative,

$I_C = -I_T$ $\quad SR = -\frac{I_T}{C_L}$

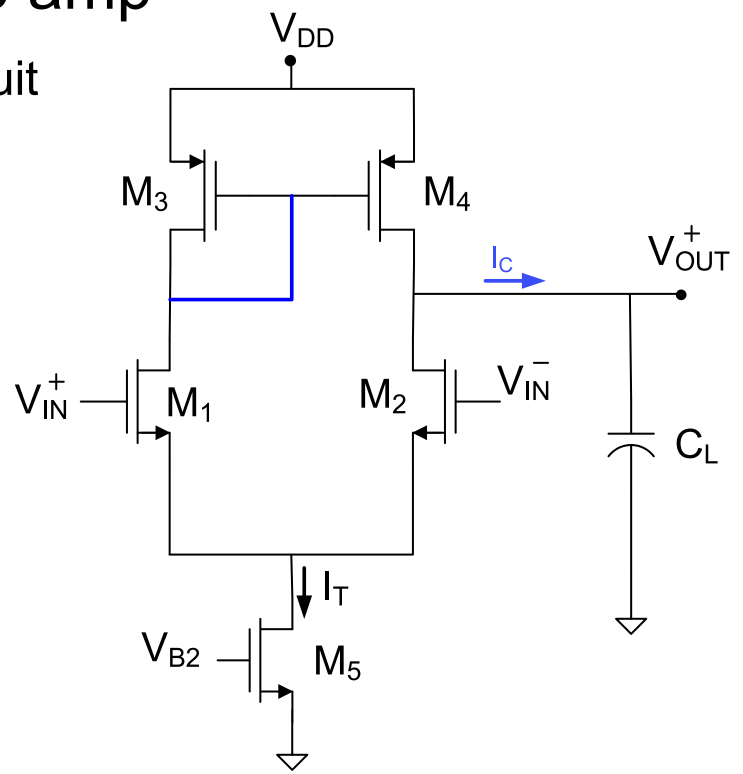
When Vd large and positive,

$I_C = I_T$ $\quad SR = \frac{I_T}{C_L}$

In terms of practical parameter set

$$SR = \frac{P}{V_{DD} C_L}$$

SR is double that of the 5T op amp !



$$V_d = V_{IN}^{+} - V_{IN}^{-}$$

No CMFB Circuit Needed

Single-stage low-gain differential op amp

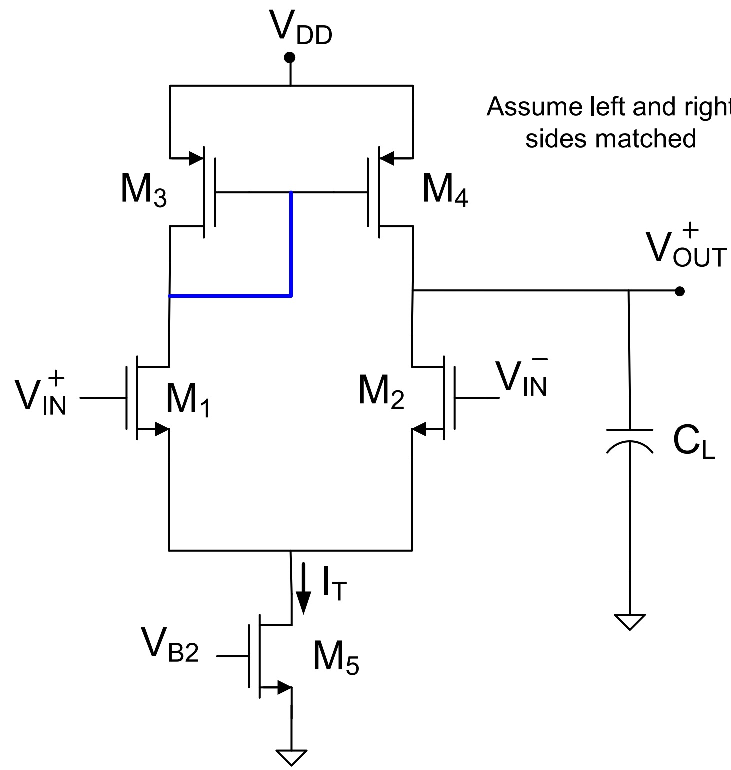
Current-Mirror Connected Counterpart Circuit

No CMFB Circuit Needed

$$A(s) = \frac{g_{m1}}{sC_L + g_{O1} + g_{O3}}$$

$$A_O = \frac{g_{m1}}{g_{O1} + g_{O3}}$$

$$GB = \frac{g_{m1}}{C_L} \qquad SR = \frac{I_T}{C_L}$$



In terms of practical design space parameters

$$A_0 = \left[\frac{1}{\lambda_1 + \lambda_3}\right]\left(\frac{2}{V_{EB1}}\right) \qquad GB = \left(\frac{P}{V_{DD}C_L}\right) \bullet \left[\frac{1}{V_{EB1}}\right] \qquad SR = \frac{P}{V_{DD}C_L}$$

Is a factor of 2 improvement in A_0, GB, and SR significant?

Amplifier Comparison

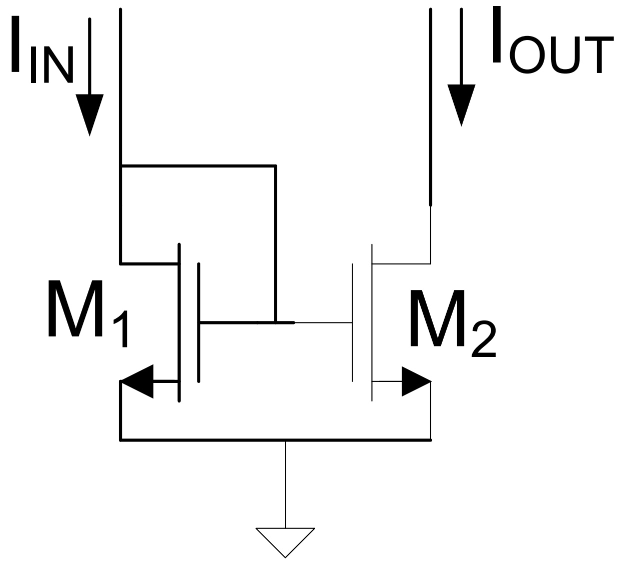
Small Signal Parameter Domain			
Reference Op Amp (single-ended ouput) (5T Op Amp)	$A_{VO}=\frac{1}{2}\frac{g_{m1}}{g_{O1}+g_{O3}}$	$GB=\frac{g_{m1}}{2C_L}$	$SR=\frac{g_{01}}{\lambda C_L}$
Practical Parameter Domain			
Reference Op Amp (single-ended ouput) (5T Op Amp)	$A_{V0}=\left[\frac{1}{\lambda_1+\lambda_3}\right]\left(\frac{1}{V_{EB1}}\right)$	$GB=\left(\frac{P}{2V_{DD}C_L}\right)\bullet\left[\frac{1}{V_{EB1}}\right]$	$\mathbf{SR}=\frac{\mathbf{P}}{\mathbf{2V_{DD}C_L}}$

Small Signal Parameter Domain			
Op Amp with CM Load and M_1 QC (5T Op Amp wCM)	$A_{VO}=\frac{g_{m1}}{g_{O1}+g_{O3}}$	$GB=\frac{g_{m1}}{C_L}$	$SR=2\frac{g_{01}}{\lambda C_L}$
Practical Parameter Domain			
Op Amp with CM Load and M_1 QC (5T Op Amp wCM)	$A_{V0}=\left[\frac{2}{\lambda_1+\lambda_3}\right]\left(\frac{1}{V_{EB1}}\right)$	$GB=\left(\frac{P}{V_{DD}C_L}\right)\bullet\left[\frac{1}{V_{EB1}}\right]$	$SR=\frac{P}{V_{DD}C_L}$

Current Mirrors

- Current mirrors are really just current amplifiers
- Current mirror (from counterpart circuit) can be used to eliminate CMFB and double gain in basic op amp
- Many different current mirrors exist with varying levels of performance (performance with some better than counterpart current mirror)
- Current mirror not necessarily from counterpart of quarter circuit but often is

Basic Current Mirror



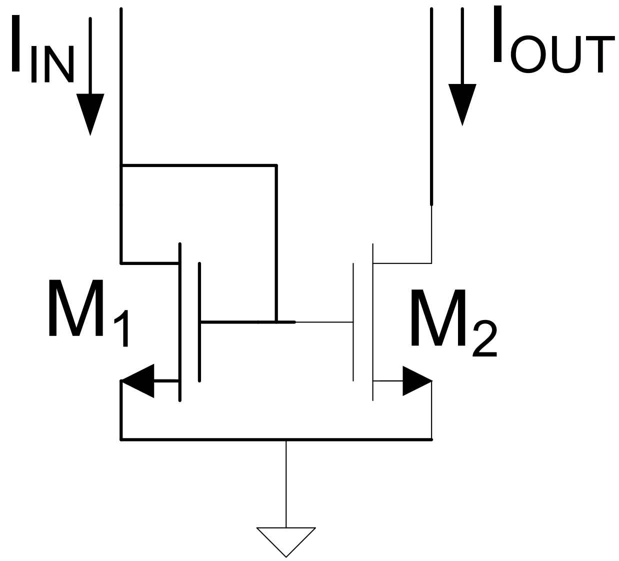
n-channel

$$I_{IN} = \frac{\mu C_{OX} W_1}{2L_1}\left(V_{GS1} - V_T\right)^2$$

$$I_{OUT} = \frac{\mu C_{OX} W_2}{2L_2}\left(V_{GS2} - V_T\right)^2$$

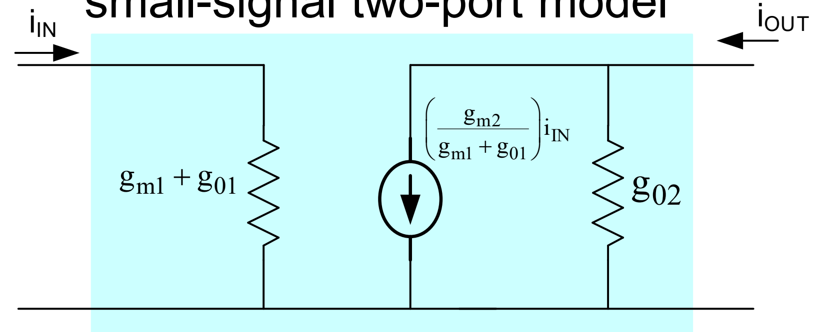
$$\frac{I_{OUT}}{I_{IN}} = \frac{W_2}{W_1}\frac{L_1}{L_2}$$

Basic Current Mirror

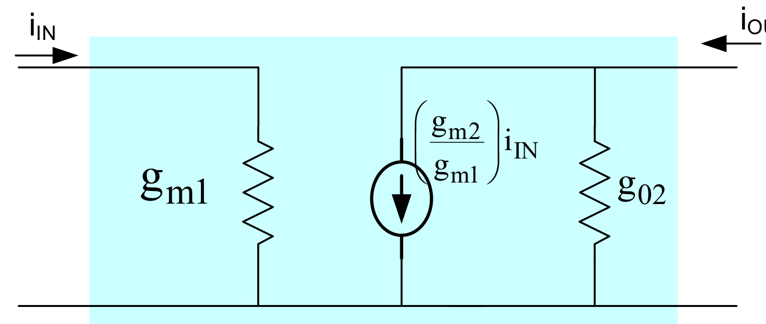


n-channel

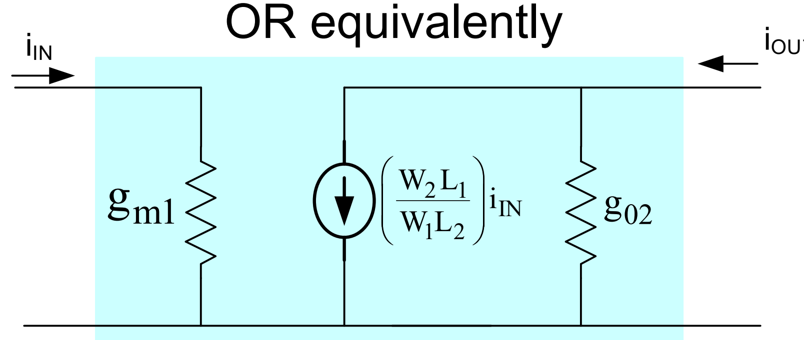
small-signal two-port model



Simplified small-signal two-port model

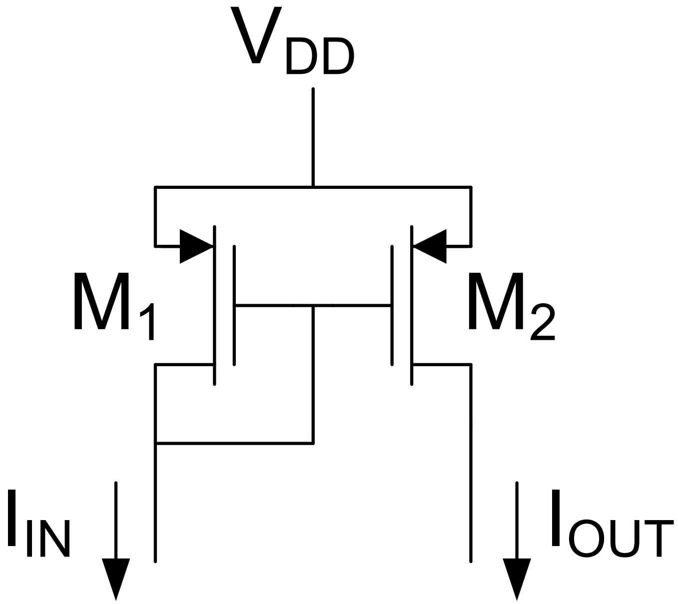


OR equivalently



If g_{02} is neglected $i_{OUT} = \left(\frac{W_2 L_1}{W_1 L_2}\right) i_{IN}$

Basic Current Mirror



p-channel

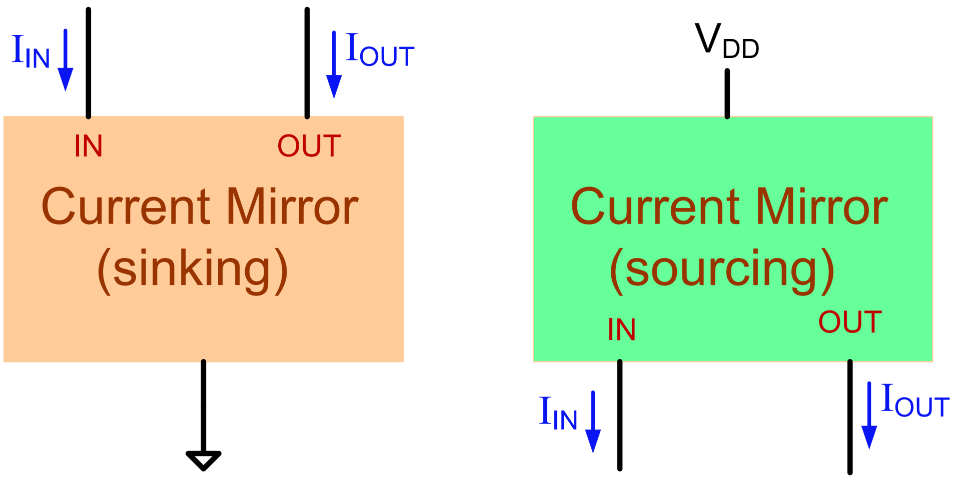
$$I_{IN} = \frac{\mu C_{OX} W_1}{2L_1}\left(V_{GS1} - V_T\right)^2$$

$$I_{OUT} = \frac{\mu C_{OX} W_2}{2L_2}\left(V_{GS2} - V_T\right)^2$$

$$\frac{I_{OUT}}{I_{IN}} = \frac{W_2}{W_1}\frac{L_1}{L_2}$$

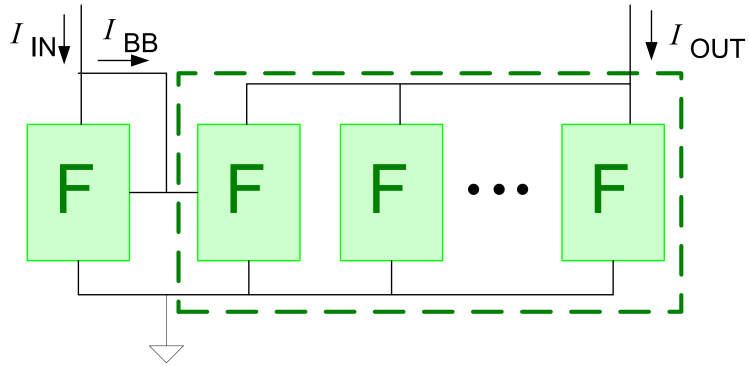
Since counterpart of n-channel current mirror, small signal models identical

Current Mirrors



- More advanced current mirrors exist
- Several of these are discussed in the text

Current Mirrors



K copies of F on right

$$I_{OUT} = KI_{IN}$$

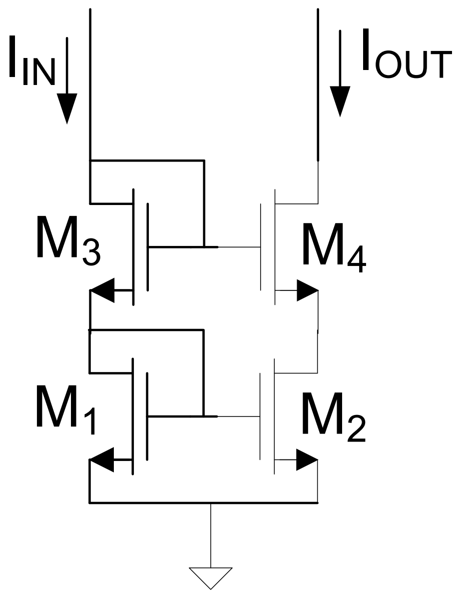
- Quarter circuits with high output impedance are useful for building current mirrors
- Replication of K copies is often simply denoted as a device sizing or scaling factor

Properties of Current Mirrors of Interest:

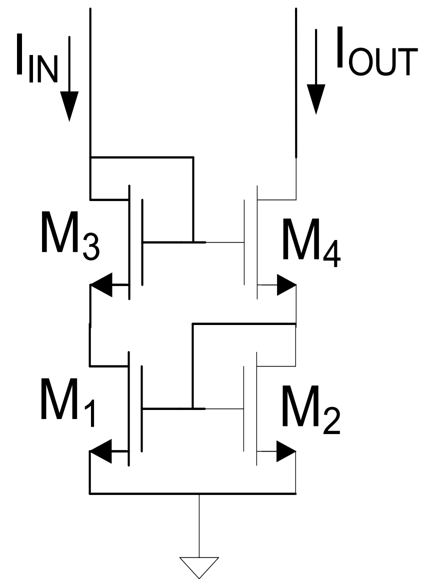
- Mirror Gain Accuracy
- Signal Swing at Output
- Output Impedance (ideally infinite)

More advanced current mirrors usually offer improvements in one or more of these properties but at the expense of another of these properties.

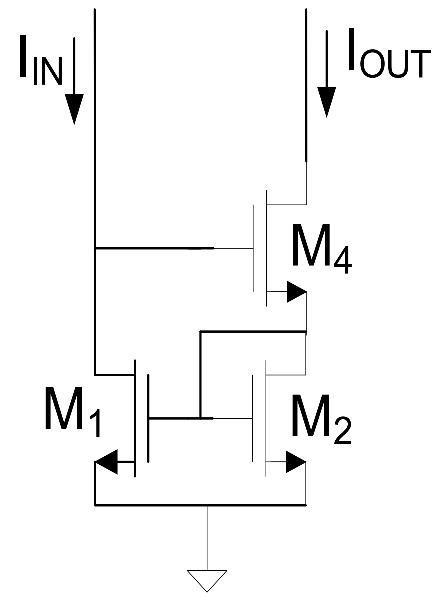
More Advanced Current Mirrors



Cascode Current Mirror

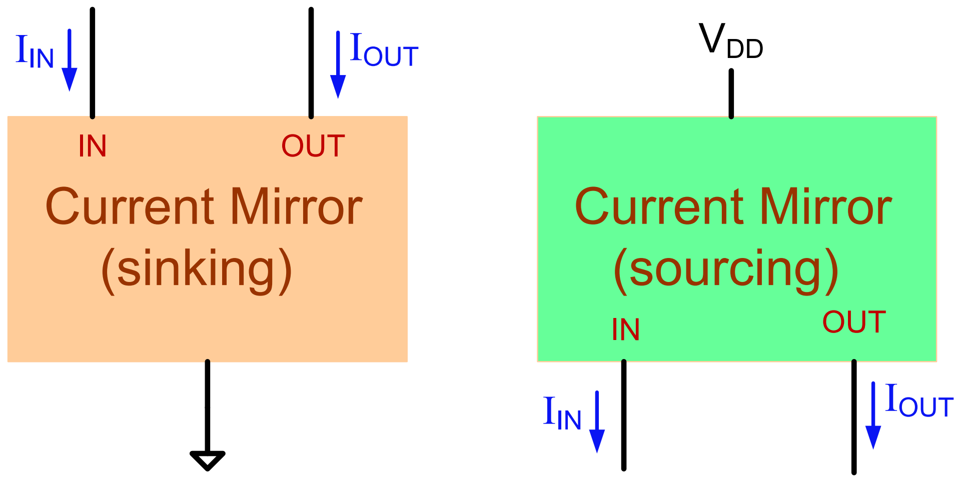


Modified Wilson Current Mirror



Wilson Current Mirror

Current Mirrors



- The concept of the current mirror was first introduced in about 1969 (not certain who introduced it but probably Wheatley and Wittlinger)
- Many of the basic current mirror circuits were introduced within a few years after the concept first appeared
- How many current mirror circuits are there?
- Have any current mirrors been introduced recently?
- Is there still an opportunity to contribute to the current mirror field?

7	10,373,681	T	Methods and apparatuses having a voltage generator with an adjustable voltage drop for representing a voltage drop of a memory ce
8	10,353,421	T	Current mirror device and related amplifier circuit
9	10,340,004	T	Write voltage generating circuit comprising a current mirror
10	10,332,590	T	Static random access memory (SRAM) bit cells employing current mirror-gated read ports for reduced power consumption
11	10,331,844	T	Methods of tuning current ratio in a current mirror for transistors formed with the same FEOL layout and a modified BEOL layout
12	10,317,925	T	Attenuating common mode noise current in current mirror circuits
13	10,228,713	T	Large range current mirror
14	10,133,293	T	Low supply active current mirror
15	10,133,292	T	Low supply current mirror
16	10,095,259	T	Circuit arrangement for compensating current variations in current mirror circuit
17	10,089,929	T	Pixel driver circuit with load-balance in current mirror circuit
18	10,076,326	T	Surgical stapler having current mirror-based motor control
19	10,054,974	T	Current mirror devices using cascode with back-gate bias
20	10,038,431	T	Current mirror array for high-frequency clock generator

USPTO search on Jan 21, 2018

569 patents with “current” and “mirror” in title since 1976

	PAT. NO.		Title
1	9,864,395	T	Base current compensation for a BJT current mirror
2	9,857,824	T	Calibration of a resistor in a current mirror circuit
3	9,829,906	T	Current mirror circuit and receiver using the same
4	9,787,178	T	Current mirror circuit and charge pump circuit
5	9,746,871	T	Noise canceling current mirror circuit for improved PSR
6	9,740,232	T	Current mirror with tunable mirror ratio
7	9,728,256	T	Methods and apparatuses having a voltage generator with an adjustable voltage drop for representing a voltage drop
8	9,713,212	T	Current mirror circuit and method
9	9,693,417	T	LED mains voltage measurement using a current mirror
10	9,680,483	T	Current mirror circuit and charge pump circuit
11	9,671,228	T	Floating current mirror for RLG discharge control
12	9,641,167	T	Current mirror circuits with narrow bandwidth bias noise reduction
13	9,638,584	T	Differential temperature sensor with sensitivity set by current-mirror and resistor ratios without limiting DC bias
14	9,632,522	T	Current mirror bias circuit with voltage adjustment
15	9,622,303	T	Current mirror and constant-current LED driver system for constant-current LED driver IC device
16	9,595,310	T	Circuits for control of time for read operation, using a current mirror circuit to mirror a reference current into the du
17	9,563,223	T	Low-voltage current mirror circuit and method
18	9,559,641	T	Current mirror, control method, and image sensor
19	9,548,022	T	Pixel and organic light emitting display device including current mirror
20	9,497,402	T	Image lag mitigation for buffered direct injection readout with current mirror

	PAT. NO.	
1	8,618,787	T Current mirror and high-compliance single-stage amplifier
2	8,598,953	T System and method for pre-charging a current mirror
3	8,598,914	T Comparator circuit with current mirror
4	8,587,287	T High-bandwidth linear current mirror
5	8,575,971	T Current mirror and current cancellation circuit
6	8,569,674	T Multiplexed photocurrent monitoring circuit comprising current mirror circuits
7	8,537,868	T Laser diode write driver feedback, current mirror, and differential-pair circuitry
8	8,531,236	T Current mirror arrangement and method for switching on a current
9	8,519,794	T Current mirror with low headroom and linear response
10	8,511,842	T Eddy current based mirror wavefront control
11	8,502,751	T Pixel driver circuit with load-balance in current mirror circuit
12	8,471,631	T Bias circuit, power amplifier, and current mirror circuit
13	8,456,227	T Current mirror circuit
14	8,450,992	T Wide-swing cascode current mirror
15	8,441,381	T Gate leakage compensation in a current mirror

	PAT. NO.	Title
1	8,026,757 T	Current mirror circuit, in particular for a non-volatile memory device
2	7,994,861 T	System and method for pre-charging a current mirror
3	7,973,488 T	Constant current driver circuit with voltage compensated current sense mirror
4	7,933,138 T	F-RAM device with current mirror sense amp
5	7,932,712 T	Current-mirror circuit
6	7,923,942 T	Constant current source mirror tank dimmable ballast for high impedance lamps
7	7,915,948 T	Current mirror circuit
8	7,911,870 T	Fuse data read circuit having control circuit between fuse and current mirror circuit
9	7,907,012 T	Current mirror with low headroom and linear response
10	7,894,235 T	F-RAM device with current mirror sense amp
11	7,889,106 T	Current mirror circuit and digital-to-analog conversion circuit
12	7,868,808 T	Phase-locked loop circuitry using charge pumps with current mirror circuitry
13	7,859,135 T	Internal power supply circuit having a cascode current mirror circuit
14	7,858,966 T	Protected qubit based on superconducting current mirror
15	7,851,834 T	Cascode current mirror and method
16	7,839,670 T	F-RAM device with current mirror sense amp
17	7,834,694 T	Differential current mirror circuit

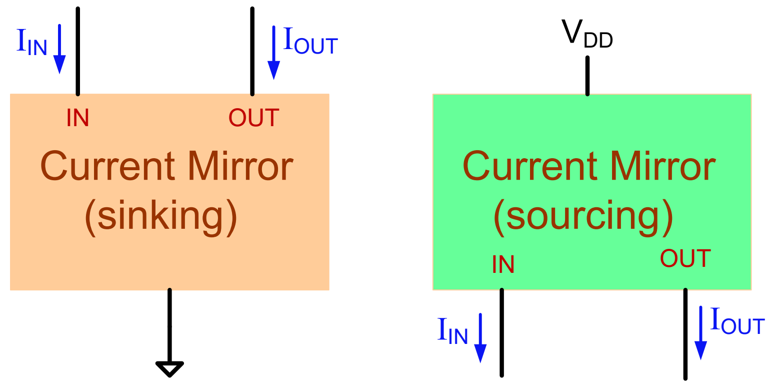
USPTO search on Jan 27, 2022

612 patents with “current and mirror” in title between 1976 and 2021

7 patents with “current and mirror” in title in 2021

- Averaged 12.4 patents/year from 1976 to 2006
- Averaged 17 patents/year in 2012 and 2013
- Averaged 13 patents/year in 2016 and 2017
- Averaged 13 patents/year in 2018 and 2020
- 7 patents from Feb 2, 2021 to Jan 27, 2022

USPTO search on Jan 21, 2018



612 patents with “current and mirror” in title since 1976

Number of patents/year in past decade is still close to the 3-decade average

Is there still an opportunity to contribute to the current mirror field?

Stay Safe and Stay Healthy !
